# Table of Contents

About this guide .....	xvii
1. Getting started - help to navigate the user guide .....	1
2. What is DHIS2? .....	5
2.1. DHIS2 Background .....	5
2.2. Key features and purpose of DHIS2 .....	5
2.3. Use of DHIS2 in HIS: data collection, processing, interpretation, and analysis. ....	6
2.4. Technical background .....	7
2.4.1. DHIS2 as a platform .....	7
2.4.2. Understanding platform independence .....	8
2.4.3. Deployment strategies - online vs offline .....	8
2.4.3.1. Offline Deployment .....	8
2.4.3.2. Online deployment .....	9
2.4.3.3. Hybrid deployment .....	10
2.4.3.4. Server hosting .....	10
2.5. Difference between Aggregated and Patient data in a HIS .....	12
2.6. Free and Open Source Software (FOSS): benefits and challenges .....	12
3. Manage dashboards .....	15
3.1. About dashboards .....	15
3.2. Set up the dashboard .....	15
3.3. Change dashboards name .....	16
3.4. Add message widget to dashboards .....	16
3.5. Delete dashboards .....	16
3.6. Translate dashboard names .....	16
3.7. Dashboard sharing .....	16
3.8. Manage messages and feedback messages .....	17
3.8.1. About messages and feedback messages .....	17
3.8.2. Create a message .....	18
3.8.3. Read a message .....	18
3.8.4. Create a feedback message .....	18
3.8.5. Manage feedback messages .....	19
3.8.6. Configure feedback message function .....	20
4. Using the Data Entry app .....	21
4.1. About the Data Entry app .....	21
4.2. Enter data in a data entry form .....	21
4.3. Mark a data value for follow-up .....	23
4.4. Edit data values in a completed data entry form .....	23
4.5. Display a data value's history .....	24
4.6. Display a data value's audit trail .....	24
4.7. Create minimum maximum value range manually .....	25
4.8. Enter data offline .....	25
4.9. Enable multi-organisation unit data entry .....	26
4.10. See also .....	27
5. Using the Event Capture app .....	29
5.1. About the Event Capture app .....	29
5.2. Register an event .....	30
5.3. Edit an event .....	30
5.4. Edit events in grid .....	31
5.5. Share events in edit mode .....	31
5.6. View an event audit history .....	31
5.7. Delete an event .....	31
5.8. Modify an event list's layout .....	32
5.9. Print an event list .....	32
5.10. Download an event list .....	32
6. Using the Tracker Capture app .....	33

6.1. About the Tracker Capture app .....	33
6.2. About tracked entity instance (TEI) dashboards .....	34
6.3. Workflow .....	34
6.4. Create a TEI .....	35
6.5. Create a TEI and enroll it in a program .....	35
6.6. Open an existing TEI dashboard .....	36
6.6.1. Simple TEI search .....	36
6.6.2. Advanced TEI search .....	36
6.6.3. Find a TEI outside your organisation unit .....	37
6.6.4. Download TEI search results list .....	37
6.6.5. Modify TEI search results list's layout .....	37
6.7. Enroll an existing TEI in a program .....	38
6.8. Enter event data for a TEI .....	38
6.9. Manage a TEI's enrollments .....	38
6.9.1. Deactivate a TEI's enrollment .....	38
6.9.2. Activate a TEI's enrollment .....	39
6.9.3. Mark TEI's enrollment as complete .....	39
6.9.4. Reopen completed enrollment .....	39
6.9.5. Display TEI's enrollment history .....	39
6.9.6. Create a TEI enrollment note .....	39
6.10. Send a message to a TEI .....	39
6.11. Mark a TEI for follow-up .....	40
6.12. Edit a TEI's profile .....	40
6.13. Add a relationship to a TEI .....	40
6.14. Share a TEI dashboard .....	41
6.15. Deactivate a TEI .....	41
6.16. Activate a TEI .....	41
6.17. Delete a TEI .....	41
6.18. Configure the TEI dashboard .....	42
6.18.1. Show or hide widgets .....	42
6.18.2. Save the dashboard's layout as default .....	42
6.19. Create reports .....	42
7. Analyze data in pivot tables .....	45
7.1. About the Pivot Table app .....	45
7.2. Create a pivot table .....	45
7.2.1. Select dimension items .....	46
7.2.2. Modify pivot table layout .....	48
7.3. Change the display of your pivot table .....	49
7.4. Manage favorites .....	52
7.4.1. Open a favorite .....	52
7.4.2. Save a favorite .....	52
7.4.3. Rename a favorite .....	53
7.4.4. Write an interpretation for a favorite .....	53
7.4.5. Create a link to a favorite .....	53
7.4.6. Delete a favorite .....	53
7.4.7. View interpretations based on relative periods .....	53
7.5. Download data from a pivot table .....	53
7.5.1. Download table layout data format .....	53
7.5.2. Download plain data source format .....	54
7.5.3. Download a CSV format without rendering data in the web browser .....	55
7.6. Embed a pivot table in an external web page .....	55
7.7. Visualize pivot table data as a chart or a map .....	55
7.7.1. Open a pivot table as a chart .....	55
7.7.2. Open a pivot table selection as a chart .....	56
7.7.3. Open a pivot table as a map .....	56
7.7.4. Open a pivot table selection as a map .....	56
8. Using the Data Visualizer app .....	57

8.1. About the Data Visualizer app .....	57
8.2. Create a chart .....	57
8.3. Select a chart type .....	58
8.4. Select dimension items .....	58
8.4.1. Select indicators .....	59
8.4.2. Select data elements .....	59
8.4.3. Select reporting rates .....	59
8.4.4. Select fixed and relative periods .....	59
8.4.5. Select organisation units .....	60
8.4.6. Select additional dimension items .....	60
8.5. Select series, category and filter .....	61
8.6. Change the display of your chart .....	62
8.7. Manage favorites .....	64
8.7.1. Open a favorite .....	64
8.7.2. Save a favorite .....	64
8.7.3. Rename a favorite .....	64
8.7.4. Write an interpretation for a favorite .....	65
8.7.5. Create a link to a favorite .....	65
8.7.6. Delete a favorite .....	65
8.7.7. View interpretations based on relative periods .....	65
8.8. Download a chart as an image or a PDF .....	65
8.9. Download chart data source .....	66
8.10. Embed charts in any web page .....	66
8.11. Open a chart as a pivot table or as a map .....	67
9. Using the GIS app .....	69
9.1. About the GIS app .....	69
9.2. Create a new thematic map .....	69
9.3. Manage event layers .....	70
9.3.1. Create or modify event layer .....	70
9.3.2. Turn off cluster .....	71
9.3.3. Modify cluster style .....	72
9.3.4. Modify information in event pop-up windows .....	72
9.3.5. Clear event layer .....	72
9.4. Manage facility layers .....	72
9.4.1. Create or modify a facility layer .....	73
9.4.2. Search for an organisation unit .....	73
9.4.3. Clear facility layer .....	73
9.5. Manage facilities in a layer .....	73
9.5.1. Relocate a facility .....	74
9.5.2. Swap longitude and latitude of a facility .....	74
9.5.3. Display facility information .....	74
9.6. Manage thematic layers 1- 4 .....	74
9.6.1. Create or modify a thematic layer .....	75
9.6.2. Filter values in a thematic layer .....	75
9.6.3. Search for an organisation unit .....	76
9.6.4. Navigate between organisation hierarchies .....	76
9.6.5. Clear thematic layer .....	76
9.7. Manage boundary layers .....	76
9.7.1. Create or modify boundary layers .....	77
9.7.2. Search for organisation units .....	77
9.7.3. Navigate between organisation hierarchies .....	77
9.7.4. Clear boundary layer .....	77
9.8. Manage Earth Engine layer .....	78
9.8.1. Create or modify an Earth Engine layer .....	78
9.9. Add external map layers .....	79
9.10. Manage map favorites .....	81
9.10.1. Save a map as a favorite .....	81

9.10.2. Open a favorite .....	81
9.10.3. Rename a favorite .....	81
9.10.4. Overwrite a favorite .....	82
9.10.5. Share a map interpretation .....	82
9.10.6. Modify sharing settings for a favorite .....	82
9.10.7. Delete a favorite .....	83
9.11. Save a map as an image .....	83
9.12. Embed a map in an external web page .....	83
9.13. Search for a location .....	83
9.14. Measure distances and areas in a map .....	84
9.15. Get the latitude and longitude at any location .....	84
9.16. View a map as a pivot table or chart .....	84
9.16.1. Open a map as a chart .....	84
9.16.2. Open a map as a pivot table .....	84
9.17. See also .....	84
10. Using the Event Reports app .....	85
10.1. About the Event Reports app .....	85
10.2. Create an event report .....	85
10.3. Select dimension items .....	86
10.4. Select series, category and filter .....	87
10.5. Change the display of your table .....	87
10.6. Download chart data source .....	89
10.7. Manage favorites .....	89
10.7.1. Open a favorite .....	89
10.7.2. Save a favorite .....	89
10.7.3. Rename a favorite .....	90
10.7.4. Write an interpretation for a favorite .....	90
10.7.5. Create a link to a favorite .....	90
10.7.6. Delete a favorite .....	90
10.7.7. View interpretations based on relative periods .....	90
10.8. Visualize an event report as a chart .....	91
11. Using the Event Visualizer app .....	93
11.1. About the Event Visualizer app .....	93
11.2. Create a chart .....	93
11.3. Select a chart type .....	93
11.4. Select dimension items .....	94
11.5. Select series, category and filter .....	96
11.6. Change the display of your chart .....	96
11.7. Download a chart as an image or a PDF .....	98
11.8. Download chart data source .....	98
11.9. Manage favorites .....	99
11.9.1. Open a favorite .....	99
11.9.2. Save a favorite .....	99
11.9.3. Rename a favorite .....	99
11.9.4. Write an interpretation for a favorite .....	99
11.9.5. Create a link to a favorite .....	100
11.9.6. Delete a favorite .....	100
11.9.7. View interpretations based on relative periods .....	100
11.10. Visualize a chart as a pivot table .....	100
12. Control data quality .....	101
12.1. About data quality checks .....	101
12.2. Validation rule analysis .....	101
12.2.1. About validation rule analysis .....	101
12.2.2. Workflow .....	102
12.2.3. Schedule a validation rule analysis to run automatically .....	102
12.2.4. Run a validation rule analysis manually .....	102
12.2.5. See also .....	103

12.3. Standard deviation outlier analysis .....	103
12.3.1. About standard deviation outlier analysis .....	103
12.3.2. Run a standard deviation outlier analysis .....	104
12.3.3. Modify a standard deviation outlier value .....	105
12.4. Minimum maximum outlier analysis .....	105
12.4.1. About minimum maximum value based outlier analysis .....	105
12.4.2. Workflow .....	106
12.4.3. Configure a minimum maximum outlier analysis .....	106
12.4.3.1. Create minimum maximum value range automatically .....	106
12.4.3.2. Create minimum maximum value range manually .....	107
12.4.3.3. Delete minimum maximum value range .....	107
12.4.4. Run a minimum maximum outlier analysis .....	108
12.5. Follow-up analysis .....	109
12.5.1. About follow-up analysis .....	109
12.5.2. Create list of data values marked for follow-up .....	109
13. Data approval .....	111
13.1. Approving and accepting .....	111
13.2. Authorities for approving data .....	112
13.3. Configuring data approval .....	112
13.4. Data visibility .....	113
13.5. Approving data .....	114
13.6. Approving by category option group set .....	114
13.6.1. Approving by one category option group set .....	114
13.6.2. Approving by multiple category option group sets .....	115
14. Using reporting functionality .....	117
14.1. Reporting functionality in DHIS2 .....	117
14.2. Using standard reports .....	117
14.3. Using dataset reports .....	118
14.4. Using resources .....	119
14.5. Using reporting rate summary .....	119
14.6. Using organisation unit distribution reports .....	120
14.7. Generate analytics tables .....	121
15. Set user account preferences .....	123
16. Manage users, user roles and user groups .....	125
16.1. About user management .....	125
16.1.1. About users .....	126
16.1.2. About user roles .....	126
16.1.3. About user groups .....	127
16.2. Workflow .....	127
16.3. Manage users .....	127
16.3.1. Create a user .....	127
16.3.2. Edit user objects .....	130
16.3.3. Disable users .....	131
16.3.4. Display a user's profile .....	131
16.3.5. View users by organisation unit .....	131
16.3.6. Assign search organisation units to users .....	131
16.3.7. Delete current user .....	131
16.3.8. Clone users .....	131
16.3.9. Change user password .....	132
16.3.10. Delete user objects .....	132
16.3.11. Display details of user objects .....	132
16.4. Manage user roles .....	133
16.4.1. Create a user role .....	133
16.4.2. Edit user objects .....	133
16.4.3. Delete user objects .....	134
16.4.4. Display details of user objects .....	134
16.4.5. Change sharing settings for user objects .....	134

16.5. Manage user groups .....	134
16.5.1. Create a user group .....	134
16.5.2. Join user groups .....	134
16.5.3. Leave user groups .....	134
16.5.4. Edit user objects .....	134
16.5.5. Delete user objects .....	135
16.5.6. Display details of user objects .....	135
16.5.7. Change sharing settings for user objects .....	135
16.6. Enable support for OpenID .....	135
16.7. Decentralize user management .....	135
16.8. Example: user management in a health system .....	136
17. Visualize usage statistics .....	139
17.1. About the Usage Analytics app .....	139
17.2. Create a usage analytics graph .....	139
18. Configure metadata .....	141
18.1. About the Maintenance app .....	141
18.2. Manage categories .....	141
18.2.1. About categories .....	141
18.2.2. Workflow .....	142
18.2.3. Create or edit a category option .....	142
18.2.4. Create or edit a category .....	142
18.2.5. Create or edit a category combination .....	143
18.2.6. Create or edit a category option group .....	143
18.2.7. Create or edit a category option group set .....	144
18.2.8. Use category combinations for data sets .....	144
18.2.9. Assign a code to a category option combination .....	145
18.2.10. Clone metadata objects .....	145
18.2.11. Change sharing settings for metadata objects .....	145
18.2.12. Delete metadata objects .....	146
18.2.13. Display details of metadata objects .....	146
18.2.14. Translate metadata objects .....	146
18.3. Manage data elements .....	147
18.3.1. About data elements .....	147
18.3.2. Workflow .....	147
18.3.3. Create or edit a data element .....	147
18.3.4. Create or edit a data element group .....	150
18.3.5. Create or edit a data element group set .....	151
18.3.6. Clone metadata objects .....	151
18.3.7. Change sharing settings for metadata objects .....	151
18.3.8. Delete metadata objects .....	152
18.3.9. Display details of metadata objects .....	152
18.3.10. Translate metadata objects .....	152
18.4. Manage data sets and data entry forms .....	153
18.4.1. About data sets and data entry forms .....	153
18.4.2. Workflow .....	155
18.4.3. Create or edit a data set .....	155
18.4.4. Override data elements' category combinations in a data set .....	157
18.4.5. Edit compulsory data elements in a data set .....	158
18.4.6. Download default data forms in PDF format .....	158
18.4.7. Manage section forms .....	158
18.4.7.1. Create a section form .....	158
18.4.7.2. Edit a section form .....	159
18.4.7.3. Manage grey fields in a section form .....	160
18.4.7.4. Change section display order in a section form .....	160
18.4.7.5. Delete a section in a section form .....	161
18.4.7.6. Translate a section in a section form .....	161
18.4.8. Manage custom forms .....	161

18.4.8.1. Create a custom form .....	161
18.4.8.2. Scripting in custom forms .....	162
18.4.9. Change sharing settings for metadata objects .....	163
18.4.10. Delete metadata objects .....	164
18.4.11. Display details of metadata objects .....	164
18.4.12. Translate metadata objects .....	164
18.5. Manage indicators .....	165
18.5.1. About indicators .....	165
18.5.2. Workflow .....	167
18.5.3. Create or edit an indicator type .....	167
18.5.4. Create or edit an indicator .....	168
18.5.5. Create or edit an indicator group .....	170
18.5.6. Create or edit an indicator group set .....	170
18.5.7. Clone metadata objects .....	171
18.5.8. Change sharing settings for metadata objects .....	171
18.5.9. Delete metadata objects .....	171
18.5.10. Display details of metadata objects .....	172
18.5.11. Translate metadata objects .....	172
18.6. Manage organisation units .....	172
18.6.1. About organisation units .....	172
18.6.2. Workflow .....	173
18.6.3. Create or edit an organisation unit .....	174
18.6.4. Create or edit an organisation unit group .....	175
18.6.5. Create or edit an organisation unit group set .....	176
18.6.6. Assign names to organisation unit levels .....	178
18.6.7. Move organisation units within a hierarchy .....	179
18.6.8. Close an organisation unit .....	179
18.6.9. Clone metadata objects .....	179
18.6.10. Change sharing settings for metadata objects .....	179
18.6.11. Delete metadata objects .....	180
18.6.12. Display details of metadata objects .....	180
18.6.13. Translate metadata objects .....	180
18.7. [Work in progress] Manage validation rules .....	181
18.7.1. About validation rules .....	181
18.7.1.1. About sliding windows .....	181
18.7.1.2. About validation rule groups .....	182
18.7.1.3. About validation notifications .....	182
18.7.2. Create or edit a validation rule .....	182
18.7.3. Create or edit a validation rule group .....	184
18.7.4. Create or edit a validation notification .....	184
18.7.5. Clone metadata objects .....	184
18.7.6. Change sharing settings for metadata objects .....	185
18.7.7. Delete metadata objects .....	185
18.7.8. Display details of metadata objects .....	185
18.7.9. Translate metadata objects .....	185
18.8. Manage attributes .....	186
18.8.1. About attributes .....	186
18.8.2. Create or edit an attribute .....	187
18.8.3. Clone metadata objects .....	187
18.8.4. Delete metadata objects .....	187
18.8.5. Display details of metadata objects .....	187
18.8.6. Translate metadata objects .....	188
18.9. Manage constants .....	188
18.9.1. About constants .....	188
18.9.2. Create or edit a constant .....	189
18.9.3. Clone metadata objects .....	189
18.9.4. Change sharing settings for metadata objects .....	189

18.9.5. Delete metadata objects .....	189
18.9.6. Display details of metadata objects .....	190
18.9.7. Translate metadata objects .....	190
18.10. Manage option sets .....	190
18.10.1. About option sets .....	190
18.10.2. Create or edit an option set .....	191
18.10.3. Clone metadata objects .....	191
18.10.4. Change sharing settings for metadata objects .....	192
18.10.5. Delete metadata objects .....	192
18.10.6. Display details of metadata objects .....	192
18.10.7. Translate metadata objects .....	192
18.11. Manage legends .....	193
18.11.1. About legends .....	193
18.11.2. Create or edit a legend .....	193
18.11.3. Clone metadata objects .....	194
18.11.4. Change sharing settings for metadata objects .....	194
18.11.5. Delete metadata objects .....	195
18.11.6. Display details of metadata objects .....	195
18.11.7. Translate metadata objects .....	195
18.11.8. Assign a legend to indicator or data element .....	195
18.11.9. See also .....	195
18.12. Manage predictors .....	196
18.12.1. About predictors .....	196
18.12.2. Create or edit a predictor .....	196
18.12.3. Clone metadata objects .....	197
18.12.4. Delete metadata objects .....	197
18.12.5. Display details of metadata objects .....	197
18.12.6. Translate metadata objects .....	198
18.13. Manage push reports .....	198
18.13.1. About push reports .....	198
18.13.2. Create or edit a push report .....	199
18.13.3. Preview push reports .....	200
18.13.4. Run push report jobs .....	200
18.13.5. Clone metadata objects .....	200
18.13.6. Delete metadata objects .....	200
18.13.7. Display details of metadata objects .....	201
18.13.8. Translate metadata objects .....	201
18.14. Manage external map layers .....	201
18.14.1. About external map layers .....	201
18.14.2. Create or edit an external map layer .....	201
18.14.3. Clone metadata objects .....	203
18.14.4. Delete metadata objects .....	203
18.14.5. Display details of metadata objects .....	203
18.14.6. Translate metadata objects .....	203
18.15. Edit multiple object groups at once .....	204
18.15.1. Edit multiple objects in an object group .....	204
18.15.2. Edit an object in multiple object groups .....	204
19. Configure programs in the Maintenance app .....	205
19.1. About programs .....	205
19.2. Configure event programs in the Maintenance app .....	207
19.2.1. About event programs .....	207
19.2.2. Workflow: Create an event program .....	208
19.2.3. Create or edit an event program .....	208
19.2.3.1. Enter event program details .....	208
19.2.3.2. Assign data elements .....	209
19.2.3.3. Create data entry forms .....	210
19.2.3.4. Assign organisation units .....	210

19.2.3.5. Create program notifications .....	210
19.2.4. Reference information: Program notification parameters .....	211
19.3. Configure tracker programs in the Maintenance app .....	212
19.4. Configure program indicators .....	212
19.4.1. About program indicators .....	212
19.4.2. Create or edit a program indicator .....	215
19.4.3. Create or edit a program indicator group .....	215
19.4.4. Reference information: Expression and filter examples per value type ..	216
19.4.5. Reference information: Functions, variables and operators to use in program indicator expressions and filters .....	217
19.4.5.1. Functions to use in a program indicator expression or filter .....	217
19.4.5.2. Variables to use in a program indicator expression or filter .....	218
19.4.5.3. Operators to use in a program indicator filter .....	219
19.5. Configure program rules .....	220
19.5.1. About program rules .....	220
19.5.2. Workflow .....	221
19.5.3. Create or edit a program rule variable .....	221
19.5.4. Create or edit a program rule .....	223
19.5.5. Example: Program rules .....	228
19.5.6. Reference information: Operators and functions to use in program rule expression .....	235
19.6. Configure relationship types .....	240
19.6.1. About relationship types .....	240
19.6.2. Create or edit a relationship type .....	240
19.7. Configure tracked entities .....	240
19.7.1. About tracked entities .....	240
19.7.2. Create or edit a tracked entity attribute .....	240
19.7.3. Create or edit a tracked entity .....	243
19.8. Clone metadata objects .....	243
19.9. Delete metadata objects .....	243
19.10. Change sharing settings for metadata objects .....	243
19.11. Display details of metadata objects .....	244
19.12. Translate metadata objects .....	244
20. Configure programs in the Programs/Attributes app (legacy app) .....	245
20.1. About programs .....	245
20.2. Manage programs .....	247
20.2.1. Create a program .....	247
20.2.2. Assign a program to organisation units .....	248
20.2.3. Edit programs .....	249
20.2.4. Change sharing settings for programs .....	249
20.2.5. Delete programs .....	249
20.2.6. Display programs .....	249
20.2.7. Translate program names .....	249
20.3. Manage program stages .....	250
20.3.1. About program stages .....	250
20.3.2. Create a program stage .....	250
20.3.3. Create a program stage section .....	252
20.3.4. Change program stage sort order .....	252
20.3.5. Change program stage section sort order .....	252
20.3.6. Edit program stages .....	252
20.3.7. Display program stages .....	253
20.3.8. Translate program stages .....	253
20.4. Manage program notifications .....	253
20.4.1. About program notifications .....	253
20.4.2. Create a program notification .....	254
20.4.3. Create a program stage notification .....	256
20.5. Manage custom registration forms .....	257

20.5.1. About program custom registration forms .....	257
20.5.2. About program stage data entry forms .....	258
20.5.3. Create a custom program registration form .....	258
20.5.4. Create a program stage data entry form .....	258
21. About sharing of objects .....	259
21.1. Sharing of objects .....	259
21.2. Sharing and access control .....	260
21.3. Sharing applied .....	260
22. Data Administration .....	263
22.1. Data integrity .....	263
22.1.1. Data elements without data set .....	263
22.1.2. Data elements without groups .....	263
22.1.3. Data elements violating exclusive group sets .....	263
22.1.4. Data elements in data set but not in form or sections .....	263
22.1.5. Data elements assigned to data sets with different period types .....	263
22.1.6. Data sets not assigned to organisation units .....	264
22.1.7. Sections with invalid category combinations .....	264
22.1.8. Indicators with identical formulas .....	264
22.1.9. Indicators without groups .....	264
22.1.10. Invalid indicator numerators .....	264
22.1.11. Invalid indicator denominators .....	264
22.1.12. Indicators violating exclusive group sets .....	264
22.1.13. Duplicate periods .....	264
22.1.14. Organisation units with cyclic references .....	265
22.1.15. Orphaned organisation units .....	265
22.1.16. Organisation units without groups .....	265
22.1.17. Organisation units violating compulsory group sets .....	265
22.1.18. Organisation units violating exclusive group sets .....	265
22.1.19. Organisation unit groups without group sets .....	265
22.1.20. Validation rules without groups .....	265
22.1.21. Invalid validation rule left side expressions .....	266
22.1.22. Invalid validation rule right side expressions .....	266
22.2. Maintenance .....	266
22.3. Resource tables .....	267
22.4. Locale Management .....	268
22.5. SQL View .....	268
22.5.1. Creating a new SQL view .....	269
22.5.2. SQL View management .....	269
22.6. Duplicate data elimination .....	269
22.7. Data statistics .....	270
22.8. Lock exceptions .....	270
22.9. Min-Max Value Generation .....	271
22.10. Cache Statistics .....	271
22.11. Scheduling .....	271
22.12. Data synchronization .....	273
22.13. Metadata Synchronization Scheduling .....	274
23. Datastore Manager .....	275
23.1. Using the Datastore Manager .....	275
23.2. Add a new namespace and key to the Datastore Manager .....	275
23.3. Add a key to an existing namespace in the Datastore Manager .....	275
23.4. Delete a namespace or key from the Datastore Manager .....	275
23.5. Search for namespaces or keys .....	275
23.6. Search your JSON library .....	276
23.7. Edit namespaces or keys in the Datastore Manager .....	276
24. Configure the GIS app .....	277
24.1. Context .....	277
24.2. Importing coordinates .....	277

25. Configure report functionality .....	281
25.1. Data sources for reporting .....	281
25.1.1. Types of data and aggregation .....	281
25.1.1.1. Terminology .....	281
25.1.1.2. Basic rules of aggregation .....	281
25.1.1.3. Dimensions of aggregation .....	282
25.1.1.4. Aggregation operators, methods for aggregation .....	283
25.1.1.5. Advanced aggregation settings (aggregation levels) .....	283
25.1.2. Resource tables .....	284
25.1.3. Report tables .....	284
25.2. How to create report tables .....	284
25.2.1. General options .....	285
25.2.2. Selecting data .....	286
25.2.3. Selecting report parameters .....	286
25.2.4. Data element dimension tables .....	288
25.2.5. Report table - best practices .....	289
25.3. Report table outcome .....	290
25.4. Standard reports .....	291
25.4.1. What is a standard report? .....	291
25.4.2. Designing Standard reports in iReport .....	291
25.4.2.1. Download and open the design file .....	291
25.4.2.2. Editing the report .....	292
25.4.2.3. Text .....	293
25.4.2.4. Filtering the table rows .....	295
25.4.2.5. Sorting .....	297
25.4.2.6. Changing indicator/data element names .....	299
25.4.2.7. Adding horizontal totals .....	301
25.4.2.8. Groups of tables .....	301
25.4.2.9. Charts .....	305
25.4.2.10. Adding the Report to DHIS2 .....	318
25.4.2.11. Some final guidelines .....	319
25.4.3. Designing SQL based standard reports .....	319
25.4.4. Designing HTML based standard reports .....	320
26. Import and export data and metadata .....	323
26.1. Meta-data import .....	323
26.1.1. Meta-data import .....	323
26.1.1.1. Dry run before importing .....	324
26.1.1.2. Matching identifiers in DXF2 .....	326
26.1.2. Import CSV meta-data .....	326
26.1.3. GML data import .....	326
26.2. Import data .....	326
26.2.1. XML data import .....	326
26.2.2. Import CSV data .....	326
26.2.3. Event data import .....	327
26.2.4. Import PDF data .....	327
26.2.5. Import data from DHIS2 1.4 .....	327
26.2.5.1. DHIS2 1.4 File (database) Import .....	327
26.2.5.2. DHIS2 1.4 XML Import .....	328
26.2.5.3. Limitations to DHIS2 1.4 imports .....	329
26.3. Export data and meta-data .....	329
26.3.1. Metadata export .....	329
26.3.2. Metadata export with dependencies .....	330
26.3.3. Data export .....	332
26.3.4. Event data export .....	333
26.3.5. Export data to other systems .....	334
26.3.5.1. DHIS2 1.4 Meta-data export .....	334
26.3.5.2. DHIS2 1.4 Detailed Metadata Export .....	334

28.5.1. Setting up SMS service .....	388
28.5.1.1. Configure SMS Gateway .....	388
28.5.1.2. Configure GenericHttp Gateway .....	388
28.5.2. Gateway Configurations .....	389
29. DHIS2 Tutorials .....	391
29.1. Create Scorecards using the Pivot Table app .....	391
29.1.1. Create a legend for your scorecard .....	391
29.1.2. Create a scorecard in the Pivot Table app .....	392
29.1.3. Organise the layout and display of your scorecard .....	394
29.1.4. Save and share your scorecard .....	395
30. About demo server, live package and database design .....	397
30.1. Using the DHIS2 demo server .....	397
30.2. Using the DHIS2 live package .....	397
30.2.1. Starting the DHIS2 Live package .....	397
30.2.1.1. Prerequisites for DHIS2 Live .....	397
30.2.1.2. Starting up with a blank database .....	397
30.2.2. Downloading and installing the server version .....	398
30.3. Logging on to DHIS2 .....	398
30.4. Logging out of DHIS2 .....	398
30.5. Quick intro to designing a DHIS2 database .....	399
30.5.1. The organisational hierarchy .....	399
30.5.2. Data Elements .....	400
30.5.3. Datasets and data entry forms .....	401
30.5.3.1. Data entry forms .....	401

30.5.4. Validation rules .....	402
30.5.5. Indicators .....	402
30.5.6. Report tables and reports .....	402
30.5.7. GIS .....	403
30.5.8. Charts and dashboard .....	403
31. About data dimensions in DHIS2 .....	405
31.1. Data dimensions: Core building blocks in DHIS2 .....	405
31.2. Data elements: The What dimension .....	406
31.2.1. Data element categories .....	406
31.2.2. Data element group sets .....	407
31.3. The organisation unit dimension .....	408
31.3.1. Organisation unit group sets and groups .....	408
31.3.1.1. Inherit the values of an organisation unit group set .....	408
31.3.1.2. Alternative organisation unit hierarchies - advanced use of group sets and groups .....	408
31.3.2. Best practice on the use of group sets and groups .....	409
31.4. The period dimension in DHIS2 .....	409
31.4.1. Period types .....	409
31.4.2. Relative periods .....	410
31.4.3. Aggregation of periods .....	410
31.4.3.1. Sum and average aggregation along the period dimension .....	410
31.5. Data collection vs. data analysis .....	411
31.5.1. Data collection and storage .....	411
31.5.2. Input does not equal Output .....	411
31.6. Extended examples of data elements and forms .....	412
31.7. How this works in pivot tables .....	413
31.8. Case study: From paper forms to multidimensional datasets - lessons learned ..	417
31.8.1. From tables to category combinations - designing multi-dimensional data sets .....	417
31.8.2. Step-by-step approach to designing datasets .....	421
32. DHIS2 Frequently Asked Questions .....	423

# About this guide

The DHIS2 documentation is a collective effort and has been developed by the development team and users. While the guide strives to be complete, there may be certain functionalities which have been omitted or which have yet to be documented. This section explains some of the conventions which are used throughout the document.

DHIS2 is a browser-based application. In many cases, screenshots have been included for enhanced clarity. Shortcuts to various functionalities are displayed such as **Data element > Data element group**. The ">" symbol indicates that you should click **Data element** and then click **Data element group** in the user interface.

Different styles of text have been used to highlight important parts of the text or particular types of text, such as source code. Each of the conventions used in the document are explained below.

## Note

A note contains additional information which should be considered or a reference to more information which may be helpful.

## Tip

A tip can be a useful piece of advice, such as how to perform a particular task more efficiently.

## Important

Important information should not be ignored, and usually indicates something which is required by the application.

## Caution

Information contained in these sections should be carefully considered, and if not heeded, could result in unexpected results in analysis, performance, or functionality.

## Warning

Information contained in these sections, if not heeded, could result in permanent data loss or affect the overall usability of the system.

Program listings usually contain some type of computer code.  
They will be displayed with a shaded background and a different font.

**Commands will be displayed in bold text, and represent a command which would need to be executed on the operating system or database.**

Links to external web sites or cross references will be displayed in blue text, and underlined like [this..](#)

Bibliographic references will be displayed in square brackets like this [Store2007]. A full reference can be found in the bibliography contained at the end of this document.

	Learn about the DHIS2 data dimensions	<a href="#">Data dimensions in DHIS2</a>

# Chapter 2. What is DHIS2?

After reading this chapter you will be able to understand:

- What is DHIS2 and what purpose it serves with respect to health information systems (HIS)?
- What are the major technological considerations when it comes to deploying DHIS2, and what are the options are for extending DHIS2 with new modules?
- What is the difference between patient based and aggregate data?
- What are some of the benefits and challenges with using Free and Open Source Software (FOSS) for HIS?

## 2.1. DHIS2 Background

DHIS2 is a tool for collection, validation, analysis, and presentation of aggregate and patient-based statistical data, tailored (but not limited) to integrated health information management activities. It is a generic tool rather than a pre-configured database application, with an open meta-data model and a flexible user interface that allows the user to design the contents of a specific information system without the need for programming. DHIS2 is a modular web-based software package built with free and open source Java frameworks.

DHIS2 is open source software released under the BSD license and can be obtained at no cost. It runs on any platform with a Java Runtime Environment (JRE 7 or higher) installed.

DHIS2 is developed by the Health Information Systems Programme (HISP) as an open and globally distributed process with developers currently in India, Vietnam, Tanzania, Ireland, and Norway. The development is coordinated by the University of Oslo with support from NORAD and other donors.

The DHIS2 software is used in more than 40 countries in Africa, Asia, and Latin America, and countries that have adopted DHIS2 as their nation-wide HIS software include Kenya, Tanzania, Uganda, Rwanda, Ghana, Liberia, and Bangladesh. A rapidly increasing number of countries and organisations are starting up new deployments.

The documentation provided herewith, will attempt to provide a comprehensive overview of the application. Given the abstract nature of the application, this manual will not serve as a complete step-by-step guide of how to use the application in each and every circumstance, but rather will seek to provide illustrations and examples of how DHIS2 can be implemented in a variety of situations through generalized examples.

Before implementing DHIS2 in a new setting, we highly recommend reading the DHIS2 Implementation Guide (a separate manual from this one), also available at the main DHIS2 [website](#).

## 2.2. Key features and purpose of DHIS2

The key features and purpose of DHIS2 can be summarised as follows:

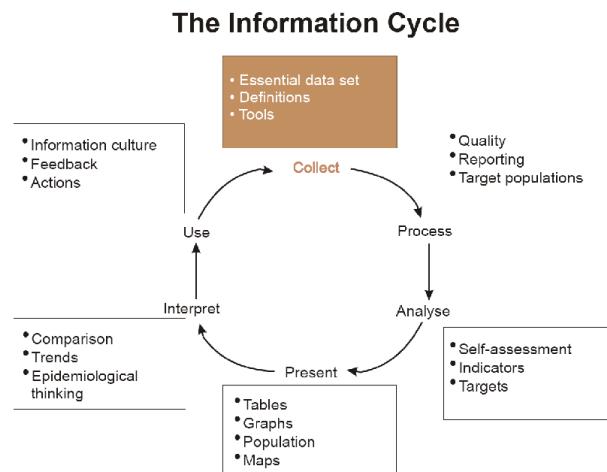

- Provide a comprehensive data management solution based on data warehousing principles and a modular structure which can easily be customised to the different requirements of a management information system, supporting analysis at different levels of the organisational hierarchy.
- Customisation and local adaptation through the user interface. No programming required to start using DHIS2 in a new setting (country, region, district etc.).
- Provide data entry tools which can either be in the form of standard lists or tables, or can be customised to replicate paper forms.

- Provide different kinds of tools for data validation and improvement of data quality.
- Provide easy to use - one-click reports with charts and tables for selected indicators or summary reports using the design of the data collection tools. Allow for integration with popular external report design tools (e.g. JasperReports) to add more custom or advanced reports.
- Flexible and dynamic (on-the-fly) data analysis in the analytics modules (i.e. GIS, PivotTables, Data Visualizer, Event reports, etc).
- A user-specific dashboard for quick access to the relevant monitoring and evaluation tools including indicator charts and links to favourite reports, maps and other key resources in the system.
- Easy to use user-interfaces for metadata management e.g. for adding/editing datasets or health facilities. No programming needed to set up the system in a new setting.
- Functionality to design and modify calculated indicator formulas.
- User management module for passwords, security, and fine-grained access control (user roles).
- Messages can be sent to system users for feedback and notifications. Messages can also be delivered to email and SMS.
- Users can share and discuss their data in charts and reports using Interpretations, enabling an active information-driven user community.
- Functionalities of export-import of data and metadata, supporting synchronisation of offline installations as well as interoperability with other applications.
- Using the DHIS2 Web-API , allow for integration with external software and extension of the core platform through the use of custom apps.
- Further modules can be developed and integrated as per user needs, either as part of the DHIS2 portal user interface or a more loosely-coupled external application interacting through the DHIS2 Web-API.

In summary, DHIS2 provides a comprehensive HIS solution for the reporting and analysis needs of health information users at any level.

## 2.3. Use of DHIS2 in HIS: data collection, processing, interpretation, and analysis.

The wider context of HIS can be comprehensively described through the information cycle presented in Figure 1.1 below. The information cycle pictorially depicts the different components, stages and processes through which the data is collected, checked for quality, processed, analysed and used.

**Figure 2.1. The health information cycle**

DHIS2 supports the different facets of the information cycle including:

- Collecting data.
- Running quality checks.
- Data access at multiple levels.
- Reporting.
- Making graphs and maps and other forms of analysis.
- Enabling comparison across time (for example, previous months) and space (for example, across facilities and districts).
- See trends (displaying data in time series to see their min and max levels).

As a first step, DHIS2 serves as a data collection, recording and compilation tool, and all data (be it in numbers or text form) can be entered into it. Data entry can be done in lists of data elements or in customised user defined forms which can be developed to mimic paper based forms in order to ease the process of data entry.

As a next step, DHIS2 can be used to increase data quality. First, at the point of data entry, a check can be made to see if data falls within acceptable range levels of minimum and maximum values for any particular data element. Such checking, for example, can help to identify typing errors at the time of data entry. Further, user can define various validation rules, and DHIS2 can run the data through the validation rules to identify violations. These types of checks help to ensure that data entered into the system is of good quality from the start, and can be improved by the people who are most familiar with it.

When data has been entered and verified, DHIS2 can help to make different kinds of reports. The first kind are the routine reports that can be predefined, so that all those reports that need to be routine generated can be done on a click of a button. Further, DHIS2 can help in the generation of analytical reports through comparisons of for example indicators across facilities or over time. Graphs, maps, reports and health profiles are among the outputs that DHIS2 can produce, and these should routinely be produced, analysed, and acted upon by health managers.

## 2.4. Technical background

### 2.4.1. DHIS2 as a platform

DHIS2 can be perceived as a platform on several levels. First, the application database is designed ground-up with flexibility in mind. Data structures such as data elements, organisation units, forms and user roles can be defined completely freely through the application user interface. This makes it possible for the system to be adapted to a multitude of locale contexts and use-cases. We have seen that DHIS2 supports most major requirements for routine data capture and analysis emerging in country implementations. It also makes it possible for DHIS2 to serve as management system for domains such as logistics, labs and finance.

Second, due to the modular design of DHIS2 it can be extended with additional software modules or through custom apps. These software modules/apps can live side by side with the core modules of DHIS2 and can be integrated into the DHIS2 portal and menu system. This is a powerful feature as it makes it possible to extend the system with extra functionality when needed, typically for country specific requirements as earlier pointed out.

The downside of the software module extensibility is that it puts several constraints on the development process. The developers creating the extra functionality are limited to the DHIS2 technology in terms of programming language and software frameworks, in addition to the

constraints put on the design of modules by the DHIS2 portal solution. Also, these modules must be included in the DHIS2 software when the software is built and deployed on the web server, not dynamically during run-time.

In order to overcome these limitations and achieve a looser coupling between the DHIS2 service layer and additional software artifacts, a REST-based API has been developed as part of DHIS2. This Web API complies with the rules of the REST architectural style. This implies that:

- The Web API provides a navigable and machine-readable interface to the complete DHIS2 data model. For instance, one can access the full list of data elements, then navigate using the provided URL to a particular data element of interest, then navigate using the provided URL to the list of data sets which the data element is a member of.
- (Meta) Data is accessed through a uniform interface (URLs) using plain HTTP requests. There are no fancy transport formats or protocols involved - just the well-tested, well-understood HTTP protocol which is the main building block of the Web today. This implies that third-party developers can develop software using the DHIS2 data model and data without knowing the DHIS2 specific technology or complying with the DHIS2 design constraints.
- All data including meta-data, reports, maps and charts, known as resources in REST terminology, can be retrieved in most of the popular representation formats of the Web of today, such as XML, JSON, PDF and PNG. These formats are widely supported in applications and programming languages and gives third-party developers a wide range of implementation options.

## 2.4.2. Understanding platform independence

All computers have an Operating System (OS) to manage it and the programs running it. The operating system serves as the middle layer between the software application, such as DHIS2, and the hardware, such as the CPU and RAM. DHIS2 runs on the Java Virtual Machine, and can therefore run on any operating system which supports Java. Platform independence implies that the software application can run on ANY OS - Windows, Linux, Macintosh etc. DHIS2 is platform independent and thus can be used in many different contexts depending on the exact requirements of the operating system to be used.

Additionally, DHIS2 supports three major database management systems (DBMS). DHIS2 uses the Hibernate database abstraction framework and is compatible with the following database systems: PostgreSQL, MySQL and H2. PostgreSQL and MySQL are high-quality production ready databases, while H2 is a useful in-memory database for small-scale applications or development activities.

Lastly, and perhaps most importantly, since DHIS2 is a browser-based application, the only real requirement to interact with the system is with a web browser. DHIS2 supports most web browsers, although currently either Google Chrome, Mozilla Firefox or Opera are recommended.

## 2.4.3. Deployment strategies - online vs offline

DHIS2 is a network enabled application and can be accessed over the Internet, a local intranet as well as a locally installed system. The deployment alternatives for DHIS2 are in this chapter defined as i) offline deployment ii) online deployment and iii) hybrid deployment. The meaning and differences will be discussed in the following sections.

### 2.4.3.1. Offline Deployment

An off-line deployment implies that multiple standalone off-line instances are installed for end users, typically at the district level. The system is maintained primarily by the end users/district health officers who enters data and generate reports from the system running on their local server. The system will also typically be maintained by a national super-user team who pay

regular visits to the district deployments. Data is moved upwards in the hierarchy by the end users producing data exchange files which are sent electronically by email or physically by mail or personal travel. (Note that the brief Internet connectivity required for sending emails does not qualify for being defined as on-line). This style of deployment has the obvious benefit that it works when appropriate Internet connectivity is not available. On the other side there are significant challenges with this style which are described in the following section.

- **Hardware:** Running stand-alone systems requires advanced hardware in terms of servers and reliable power supply to be installed, usually at district level, all over the country. This requires appropriate funding for procurement and plan for long-term maintenance.
- **Software platform:** Local installs implies a significant need for maintenance. From experience, the biggest challenge is viruses and other malware which tend to infect local installations in the long-run. The main reason is that end users utilize memory sticks for transporting data exchange files and documents between private computers, other workstations and the system running the application. Keeping anti-virus software and operating system patches up to date in an off-line environment are challenging and bad practices in terms of security are often adopted by end users. The preferred way to overcome this issue is to run a dedicated server for the application where no memory sticks are allowed and use an Linux based operating system which is not as prone for virus infections as MS Windows.
- **Software application:** Being able to distribute new functionality and bug-fixes to the health information software to users are essential for maintenance and improvement of the system. Relying on the end users to perform software upgrades requires extensive training and a high level of competence on their side as upgrading software applications might a technically challenging task. Relying on a national super-user team to maintain the software implies a lot of traveling.
- **Database maintenance:** A prerequisite for an efficient system is that all users enter data with a standardized meta-data set (data elements, forms etc). As with the previous point about software upgrades, distribution of changes to the meta-data set to numerous off-line installations requires end user competence if the updates are sent electronically or a well-organized super-user team. Failure to keep the meta-data set synchronized will lead to loss of ability to move data from the districts and/or an inconsistent national database since the data entered for instance at the district level will not be compatible with the data at the national level.

#### 2.4.3.2. Online deployment

An on-line deployment implies that a single instance of the application is set up on a server connected to the Internet. All users (clients) connect to the on-line central server over the Internet using a web browser. This style of deployment is increasingly possible due to increased availability in (mobile) Internet coverage globally, as well as readily available and cheap cloud-computing resources. These developments make it possible to access on-line servers in even the most rural areas using mobile Internet modems (also referred to as *dongles*).

This on-line deployment style has huge positive implications for the implementation process and application maintenance compared to the traditional off-line standalone style:

- **Hardware:** Hardware requirements on the end-user side are limited to a reasonably modern computer/laptop and Internet connectivity through a fixed line or a mobile modem. There is no need for a specialized server for each user, any Internet enabled computer will be sufficient. A server will be required for on-line deployments, but since there is only one (or several) servers which need to be procured and maintained, this is significantly simpler (and cheaper) than maintaining many separate servers in disparate locations. Given that cloud-computing resources continue to steadily decrease in price while increasing in computational power, setting up a powerful server in the cloud is far cheaper than procuring hardware.
- **Software platform:** The end users only need a web browser to connect to the on-line server. All popular operating systems today are shipped with a web browser and there is no special requirement on what type or version. This means that if severe problems such

as virus infections or software corruption occur one can always resort to re-formatting and installing the computer operating system or obtain a new computer/laptop. The user can continue with data entry where it was left and no data will be lost.

- **Software application:** The central server deployment style means that the application can be upgraded and maintained in a centralized fashion. When new versions of the applications are released with new features and bug-fixes it can be deployed to the single on-line server. All changes will then be reflected on the client side the next time end users connect over the Internet. This obviously has a huge positive impact for the process of improving the system as new features can be distributed to users immediately, all users will be accessing the same application version, and bugs and issues can be sorted out and deployed on-the-fly.
- **Database maintenance:** Similar to the previous point, changes to the meta-data can be done on the on-line server in a centralized fashion and will automatically propagate to all clients next time they connect to the server. This effectively removes the vast issues related to maintaining an upgraded and standardized meta-data set related to the traditional off-line deployment style. It is extremely convenient for instance during the initial database development phase and during the annual database revision processes as end users will be accessing a consistent and standardized database even when changes occur frequently.

This approach might be problematic in cases where Internet connectivity is volatile or missing in long periods of time. DHIS2 however has certain features which requires Internet connectivity to be available only part of the time for the system to work properly, such as offline data entry. In general however, DHIS2 does require Internet connectivity of some sort, but this is increasingly an easy problem to solve even in remote locations.

#### 2.4.3.3. Hybrid deployment

From the discussion so far one realizes that the on-line deployment style is favourable over the off-line style but requires decent Internet connectivity where it will be used. It is important to notice that the mentioned styles can co-exist in a common deployment. It is perfectly feasible to have on-line as well as off-line deployments within a single country. The general rule would be that districts and facilities should access the system on-line over the Internet where sufficient Internet connectivity exist, and off-line systems should be deployed to districts where this is not the case.

Defining decent Internet connectivity precisely is hard but as a rule of thumb the download speed should be minimum 10 Kbyte/second for the client and at least 1 MBit/sec (dedicated) bandwidth for the server.

In this regard mobile Internet modems which can be connected to a computer or laptop and access the mobile network is an extremely capable and feasible solution. Mobile Internet coverage is increasing rapidly all over the world, often provide excellent connectivity at low prices and is a great alternative to local networks and poorly maintained fixed Internet lines. Getting in contact with national mobile network companies regarding post-paid subscriptions and potential large-order benefits can be a wort-while effort. The network coverage for each network operator in the relevant country should be investigated when deciding which deployment approach to opt for as it might differ and cover different parts of the country.

#### 2.4.3.4. Server hosting

The on-line deployment approach raises the question of where and how to host the server which will run the DHIS2 application. Typically there are several options:

1. Internal hosting within the Ministry of Health
2. Hosting within a government data centre
3. Hosting through an external hosting company

The main reason for choosing the first option is often political motivation for having “physical ownership” of the database. This is perceived as important by many in order to “own” and

control the data. There is also a wish to build local capacity for server administration related to sustainability of the project. This is often a donor-driven initiatives as it is perceived as a concrete and helpful mission.

Regarding the second option, some places a government data centre is constructed with a view to promoting and improving the use and accessibility of public data. Another reason is that a proliferation of internal server environments is very resource demanding and it is more effective to establish centralized infrastructure and capacity.

Regarding external hosting there is lately a move towards outsourcing the operation and administration of computer resources to an external provider, where those resources are accessed over the network, popularly referred to as “cloud computing” or “software as a service”. Those resources are typically accessed over the Internet using a web browser.

The primary goal for an on-line server deployment is provide long-term stable and high-performance accessibility to the intended services. When deciding which option to choose for server environment there are many aspects to consider:

1. Human capacity for server administration and operation. There must be human resources with general skills in server administration and in the specific technologies used for the application providing the services. Examples of such technologies are web servers and database management platforms.
2. Reliable solutions for automated backups, including local off-server and remote backup.
3. Stable connectivity and high network bandwidth for traffic to and from the server.
4. Stable power supply including a backup solution.
5. Secure environment for the physical server regarding issues such as access, theft and fire.
6. Presence of a disaster recovery plan. This plan must contain a realistic strategy for making sure that the service will be only suffering short down-times in the events of hardware failures, network downtime and more.
7. Feasible, powerful and robust hardware.

All of these aspects must be covered in order to create an appropriate hosting environment. The hardware requirement is deliberately put last since there is a clear tendency to give it too much attention.

Looking back at the three main hosting options, experience from implementation missions in developing countries suggests that all of the hosting aspects are rarely present in option one and two at a feasible level. Reaching an acceptable level in all these aspects is challenging in terms of both human resources and money, especially when compared to the cost of option three. It has the benefit that is accommodates the mentioned political aspects and building local capacity for server administration, on the other hand can this be provided for in alternative ways.

Option three - external hosting - has the benefit that it supports all of the mentioned hosting aspects at a very affordable price. Several hosting providers - of virtual servers or software as a service - offer reliable services for running most kinds of applications. Example of such providers are [Linode](#) and [Amazon Web Services](#). Administration of such servers happens over a network connection, which most often anyway is the case with local server administration. The physical location of the server in this case becomes irrelevant as that such providers offer services in most parts of the world. This solution is increasingly becoming the standard solution for hosting of application services. The aspect of building local capacity for server administration is compatible with this option since a local ICT team can be tasked with maintaining the externally hosted server, but with not being burdened with worrying about power supply and bandwidth constraints which usually exist outside of major data centres.

An approach for combining the benefits of external hosting with the need for local hosting and physical ownership is to use an external hosting provider for the primary transactional system,

while mirroring this server to a locally hosted non-critical server which is used for read-only purposes such as data analysis and accessed over the intranet.

## 2.5. Difference between Aggregated and Patient data in a HIS

*Patient data* is data relating to a single patient, such as his/her diagnosis, name, age, earlier medical history etc. This data is typically based on a single patient-health care worker interaction. For instance, when a patient visits a health care clinic, a variety of details may be recorded, such as the patient's temperature, their weight, and various blood tests. Should this patient be diagnosed as having "Vitamin B 12 deficiency anaemia, unspecified" corresponding to ICD-10 code D51.9, this particular interaction might eventually get recorded as an instance of "Anaemia" in an aggregate based system. Patient based data is important when you want to track longitudinally the progress of a patient over time. For example, if we want to track how a patient is adhering to and responding to the process of TB treatment (typically taking place over 6-9 months), we would need patient based data.

*Aggregated data* is the consolidation of data relating to multiple patients, and therefore cannot be traced back to a specific patient. They are merely counts, such as incidences of Malaria, TB, or other diseases. Typically, the routine data that a health facility deals with is this kind of aggregated statistics, and is used for the generation of routine reports and indicators, and most importantly, strategic planning within the health system. Aggregate data cannot provide the type of detailed information which patient level data can, but is crucial for planning and guidance of the performance of health systems.

In between the two you have case-based data, or anonymous "patient" data. A lot of details can be collected about a specific health event without necessarily having to identify the patient it involved. Inpatient or outpatient visits, a new case of cholera, a maternal death etc. are common use-cases where one would like to collect a lot more detail than just adding to the total count of cases, or visits. This data is often collected in line-listing type of forms, or in more detailed audit forms. It is different from aggregate data in the sense that it contains many details about a specific event, whereas the aggregate data would count how many events of a certain type, e.g. how many outpatient visits with principal diagnosis "Malaria", or how many maternal deaths where the deceased did not attend ANC, or how many cholera outbreaks for children under 5 years. In DHIS2 this data is collected through programs of the type single event without registration.

Patient data is highly confidential and therefore must be protected so that no one other than doctors can get it. When in paper, it must be properly stored in a secure place. For computers, patient data needs secure systems with passwords, restrained access and audit logs.

Security concerns for aggregated data are not as crucial as for patient data, as it is usually impossible to identify a particular person to a aggregate statistic . However, data can still be misused and misinterpreted by others, and should not be distributed without adequate data dissemination policies in place.

## 2.6. Free and Open Source Software (FOSS): benefits and challenges

Software carries the instructions that tell a computer how to operate. The human authored and human readable form of those instructions is called source code. Before the computer can actually execute the instructions, the source code must be translated into a machine readable (binary) format, called the object code. All distributed software includes the object code, but FOSS makes the source code available as well.

Proprietary software owners license their copyrighted object code to a user, which allows the user to run the program. FOSS programs, on the other hand, license both the object and the source code, permitting the user to run, modify and possibly redistribute the programs. With

access to the source code, the users have the freedom to run the program for any purpose, redistribute, probe, adapt, learn from, customise the software to suit their needs, and release improvements to the public for the good of the community. Hence, some FOSS is also known as free software, where “free” refers, first and foremost, to the above freedoms rather than in the monetary sense of the word.

Within the public health sector, FOSS can potentially have a range of benefits, including:

- Lower costs as it does not involve paying for prohibitive license costs.
- Given the information needs for the health sector are constantly changing and evolving, there is a need for the user to have the freedom to make the changes as per the user requirements. This is often limited in proprietary systems.
- Access to source code to enable integration and interoperability. In the health sector interoperability between different software applications is becoming increasingly important, meaning enabling two or more systems to communicate metadata and data. This work is a lot easier, and sometimes dependent on the source code being available to the developers that create the integration. This availability is often not possible in the case of proprietary software. And when it is, it comes at a high cost and contractual obligations.
- FOSS applications like DHIS2 typically are supported by a global network of developers, and thus have access to cutting edge research and development knowledge.

# Chapter 3. Manage dashboards

## 3.1. About dashboards

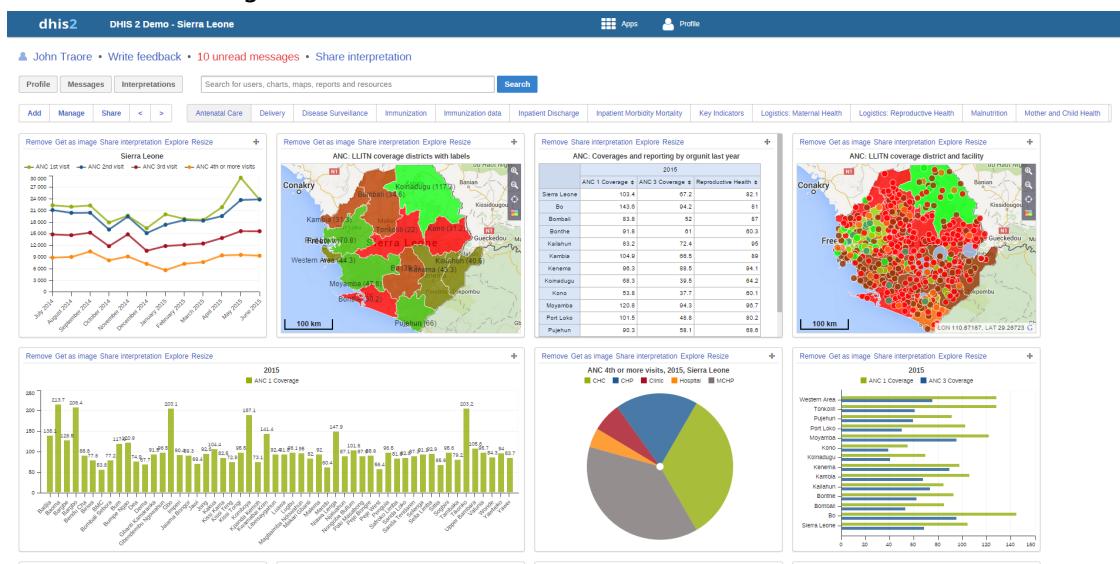

Dashboards are intended to provide quick access to different analytical objects (maps, charts, reports, tables, etc) to an individual user. Dashboards can also be shared with user groups.

### Example 3.1.

A user or administrator could create a dashboard called "Malaria" which might contain all relevant information on malaria. This dashboard could then be shared with the user group called "Malaria control", which might consist of all users of the malaria control program. All users within this group would then be able to view the same dashboard.

## 3.2. Set up the dashboard

The dashboard can contain any number of objects (charts, maps, reports, tables, resources, etc). These can be freely arranged on the dashboard as you wish. Dashboard items can be located and added by searching for favourites, resources, users or messages in the available search box and clicking on the "Add" button.

In this screen shot, the dashboard has already been populated with a number of objects, such as charts, map views, tables and messages. There are several hyperlink options available on each item:

- Remove

Allows you to remove the item from the dashboard when you have the appropriate user rights.

- Get as Image

Opens up a pop-up window and allows you to download the image to your computer.

- Share interpretation

Allows you to share an interpretation of the dashboard item. Your interpretation will be shared publicly with other users of the DHIS2 system, in the "Interpretation" section of the dashboard.

- Explore

Loads the favorite in its corresponding app (ie. a map will open full-sized in the GIS app).

- Resize

Resizes the dashboard item. There are 3 sizes in which to choose from.

Maps, charts and tables can be viewed as full size as images (in the case of charts and map views) or as HTML resources (in the case of reports, tables and messages).

To reorder how the dashboard appears, simply drag-and-drop any of the objects to a new position. In order to change between the various dashboards which are available, simply select the listed items that are available to review. The list can be scrolled though by using the <, > symbols to the left of the dashboard names.

### 3.3. Change dashboards name

1. Open a DHIS2 dashboard.
2. Click **Manage**.
3. In the **Name** field, type the new name of the dashboard.
4. Click **Rename**.

### 3.4. Add message widget to dashboards

1. Open a DHIS2 dashboard.
2. Click **Manage** and click **Messages**.

### 3.5. Delete dashboards

1. Open a DHIS2 dashboard.
2. Click **Manage** and click **Delete**.

### 3.6. Translate dashboard names

1. Open a DHIS2 dashboard.
2. Click **Manage** and click **Translate**.
3. Select a locale and enter the dashboard name's translation.
4. Click **Save**.

### 3.7. Dashboard sharing

In order to share a dashboard with user groups, first select "Share" from the dashboard page. This will bring up the dashboard sharing settings options. To share the dashboard with specific user groups, type in their name in the sharing settings dialogue box and click on the "+" sign to add them to the dashboard sharing settings

**Sharing settings**

Antenatal Care

Search for user groups

Created by: Tom Wakiki

External access (without login)

Public access (with login)

Cape Town University Research Group	None	X
Africare HQ	Can edit and view	X
	Can view	X

All dashboards have two sharing groups set by default.

- External access (without login)

This option, when selected, provides access to the dashboard as an external resource. This is useful for when you are creating an external web portal but would like to call information from a dashboard you have made internally within DHIS2. By default, this option is not selected.

- Public access (with login)

This option allows the selected dashboard to be pushed to all users within your DHIS2 instance. This can also be hidden from public view by selecting the "None" option, which is the default option for new dashboards.

User groups which have been added manually can be assigned two types of permissions within the dashboard

- Can view

Provides the user group with view only rights to the dashboard.

- Can edit and view

Allows the user groups to edit the dashboard in addition to viewing it. Editing allows for altering the layout, resizing and removing items, renaming/deleting the dashboard etc.

## 3.8. Manage messages and feedback messages

### 3.8.1. About messages and feedback messages

Messages

Within DHIS2 you can send messages and feedback messages to users, user groups and organisation units. When you send a feedback message, it is routed to a particular user group. If you're a member of this user group, you've access to feedback handling tools. You can for example set the status of an incoming feedback to "Pending" while you're waiting for information.

## Note

Messages and feedback messages are not sent to users' e-mail addresses, the messages only appear within DHIS2.

### 3.8.2. Create a message

Write new message

**Organisation Unit Selection**

To org unit

Family Planning Program Coordinators

Subject

Data review meeting

We will have a family planning data review meeting at 9am in our main office. Please attend.

Text

**Send** **Discard**

1. From the **Dashboard**, click **Messages**.
2. Click **Write message**.
3. Define who you want to receive the message. You can send a message to organisation units, users and user groups.
  - In the **To org unit** field, select the organisation units or group of organisation units you want to send the message to.
  - In the **To user** field, select the users or user groups you want to send the message to.
4. Type a subject and a message.
5. Click **Send**.

### 3.8.3. Read a message

1. From the **Dashboard**, click **Messages**.
2. Click a message.

If the message is part of a conversation, you'll see all messages in this conversation.

### 3.8.4. Create a feedback message

1. From the **Dashboard**, click **Write feedback**.

2. Type a subject and a feedback message.

3. Click **Send**.

The feedback message will appear in all of the specified users' inboxes.

### 3.8.5. Manage feedback messages

#### Note

You'll only see feedback messages and have access to the feedback handling tools if you are a member of the user group that is set up to handle feedback messages.

You'll receive feedback messages to your **Messages** inbox. For feedback messages you've the following options in addition to the messages options:

**Table 3.1. Feedback handling tools**

<b>Function</b>	<b>Description</b>
<b>Priority</b>	<p>You can mark a feedback message with different priorities: <b>None</b>, <b>Low</b>, <b>Medium</b> or <b>High</b>.</p> <p>Setting the priority makes it easier to keep track of which feedback message you need resolved first, and which feedback messages that can wait.</p>
<b>Status</b>	<p>All feedback messages get the status <b>Open</b> when created.</p> <p>To keep track of existing feedback messages, you can change the status to <b>Pending</b>, <b>Invalid</b> or <b>Solved</b>.</p> <p>You can filter feedback messages in your inbox</p>

Function	Description
	based on their status. This makes it easier to switch between feedback messages and normal messages.
<b>Assigned to</b>	<p>You can assign a feedback message to any member of the user group that is set up to handle feedback messages.</p> <p><b>None</b> means that you haven't assigned a user to the feedback message.</p>
<b>Internal reply</b>	<p>When you work in a feedback handling team you might want to discuss the feedback before sending an answer to the sender. You can keep this discussion in the same message conversation as the feedback itself.</p> <p>To send a reply that within the feedback handling user group, click <b>Internal reply</b>.</p>

### 3.8.6. Configure feedback message function

To configure the feedback message function, you must:

1. Create a user group (for example "Feedback message recipients") that contains all the users who should receive feedback messages.
2. Open the **System Settings** app and click **General > Feedback recipients** and select the user group you created in the previous step.

# Chapter 4. Using the Data Entry app

## 4.1. About the Data Entry app

The **Data Entry** app is where you manually enter aggregated data in DHIS2. You register data for an organisation unit, a period, and a set of data elements (data set) at a time. A data set often corresponds to a paper-based data collection tool. You configure the data sets in the **Maintenance** app.

### A data set can have both section and custom forms

If a data set has both a section form and a custom form, the system displays the custom form during data entry. Users who enter data can't select which form they want to use. In web-based data entry the order of display preference is:

1. Custom form (if it exists)
2. Section form (if it exists)
3. Default form

Mobile devices do not support custom forms. In mobile-based data entry the order of display preference is:

1. Section form (if it exists)
2. Default form

When you close an organisation unit, you can't register or edit data to this organisation unit in the **Data Entry** app.

## 4.2. Enter data in a data entry form

The screenshot shows the DHIS2 Data Entry interface for the Ngelelun CHC in December 2014. The left sidebar shows the organisational structure of Sierra Leone, with Ngelelun CHC selected. The main area is titled 'Data Entry' and shows the following configuration:

- Organisation Unit: Ngelelun CHC
- Data Set: Mortality < 5 years
- Period: December 2014

The data entry form displays a list of diseases with their corresponding values:

Condition	Value
Accute Flaccid Paralysis (Deaths < 5 yrs)	
Animal Bites - Rabid (Deaths < 5 yrs)	
Cholera (Deaths < 5 yrs)	
Dysentery (Deaths < 5 yrs)	
Louse Borne Typhus - Relapsing fever (Deaths < 5 yrs)	
Malaria (Deaths < 5 yrs)	
Measles (Deaths < 5 yrs)	
Meningitis (Deaths < 5 yrs)	
Plague (Deaths < 5 yrs)	
Rabies (Deaths < 5 yrs)	
Tetanus Neonatal (Deaths < 5 yrs)	
Tetanus Other (Deaths < 5 yrs)	
Typhoid (Deaths < 5 yrs)	
Yellow Fever (Deaths < 5 yrs)	

At the bottom of the form are buttons for 'Complete', 'Incomplete', and 'Run validation'.

1. Open the **Data Entry** app.
2. In the organisation unit tree to the left, select an organisation unit.
3. Select a **Data set**.
4. Select a **Period**.

The available periods are controlled by the period type of the data set (reporting frequency). You can jump a year back or forward by clicking **Prev year** or **Next year**.

## Note

Depending on how you've configured the data entry form, you might have to enter additional information before you can open the date entry form. This can for example be a project derived from a category combination.

5. Enter data in the data entry form.
  - A green field means that the system has saved the value.
  - A grey field means that the field is disabled and you can't enter a value. The cursor will automatically jump to the next open field.
  - To move to the next field, press the Tab key or the Down Arrow key.
  - To move back to the previous field, press Shift+Tab or the Up Arrow key.
  - If you type in an invalid value, for example a character in a field that only accepts numeric values, you'll get a pop-up that explains the problem and the field will be coloured yellow (not saved) until you have corrected the value.
  - If you have defined a minimum maximum value range for the field and you enter a value that is outside this range, you'll get a pop-up message that says the value is out of range. The value remains unsaved until you've changed the value or updated the value range and then re-entered the value.
6. When you've filled in the form, click **Run validation** in the top right corner or below the data entry form.

All validation rules which involves data elements in the current data entry form (data set) are then run against the new data. If there are no violations of the validation rules, you'll see a message saying *The data entry screen successfully passed validation*. If there are validation violations, they will be presented in a list.

Validation rule	Left side	Operator	Right side
Slept under LLIN at measles (fixed < 1y) cannot be higher than measles doses given (fixed < 1y)	7.0	=	4.0

7. (Optional) Correct validation violations.

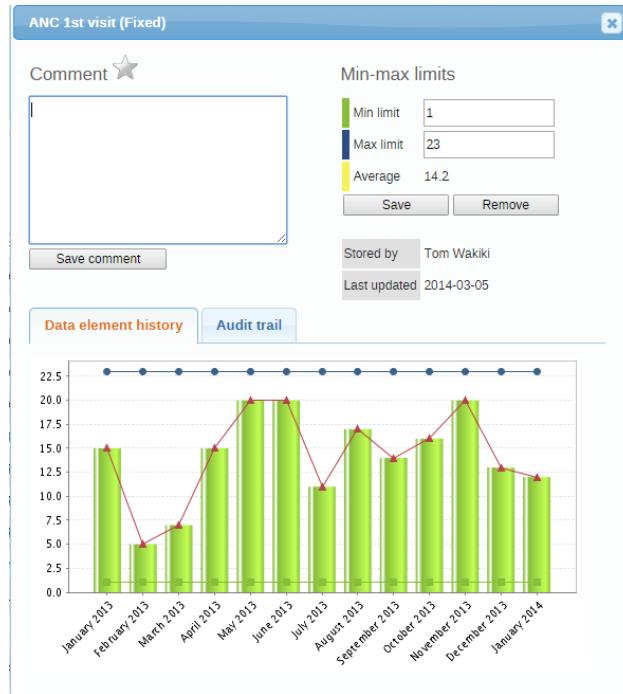

## Note

Zero (0) will delete the value if the data element has been configured to not store zeros.

8. When you've corrected errors and you're done with data entry, click **Complete**.

The system uses this information when generating completeness reports for district, county, province or the national level.

## 4.3. Mark a data value for follow-up

If you for example have a suspicious value that you need to investigate further, you can keep it in the system, but mark it for follow-up. In the **Data Quality** app you can then run a follow-up analysis to view and correct all marked values.

1. Open the **Data Entry** app.
2. Open an existing data entry form.
3. Double-click the field with the value you want to mark for follow-up.
4. Click the star icon.

## 4.4. Edit data values in a completed data entry form

1. Open the **Data Entry** app.
2. Open an existing data entry form.
3. Click **Incomplete**.
4. Change the relevant data values.

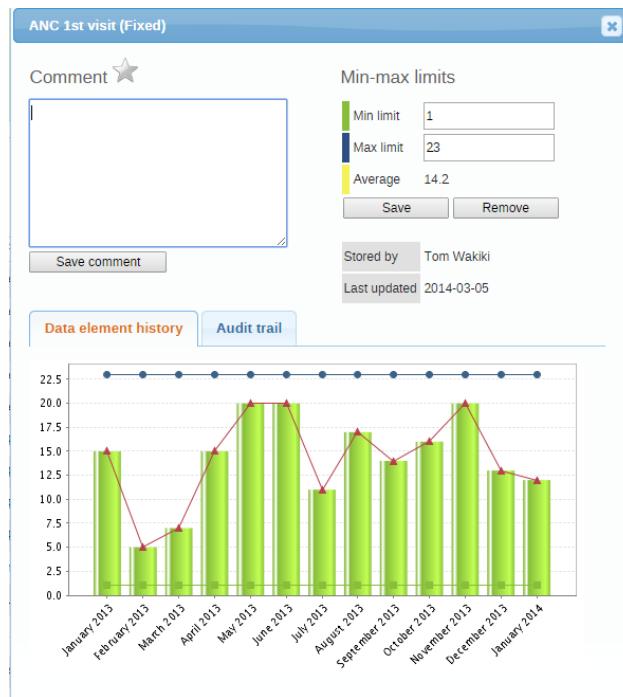

### Note

Zero (0) will delete the value if the data element has been configured to not store zeros,

5. Click **Complete**.

## 4.5. Display a data value's history

You can display the last 12 values registered for a field.

1. Open the **Data Entry** app.
2. Open an existing data entry form.
3. Double-click the field with the value you want to view the history for.
4. Click **Data element history**.

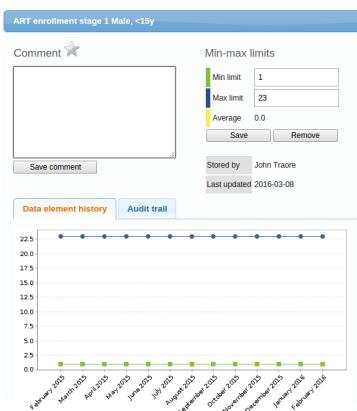

## 4.6. Display a data value's audit trail

On	Modified by	Value	Modification
2014-12-29 09:01	admin	120	Update
2014-12-29 09:00	admin	12	Update

The audit trail allows you to view other data values which have been entered prior to the current value. The audit trail also shows when the data value was altered and which user who made the changes.

1. Open the **Data Entry** app.
2. Open an existing data entry form.
3. Double-click the field with the value you want to view the audit trail for.
4. Click **Audit trail**.

## 4.7. Create minimum maximum value range manually

1. In the **Data Entry** app, open a data entry form.
2. Double-click the field for which you want to set the minimum maximum value range.
3. Enter **Min limit** and **Max limit**.
4. Click **Save**.

If values don't fall within the new value range the next time you enter data, the data entry cell will appear with an orange background.

5. (Optional) Type a comment to explain the reason for the discrepancy, for example an event at a facility which may have generated a large number of clients.
6. (Optional) Click **Save comment**.

### Tip

Click the star icon to mark the value for further follow-up.

## 4.8. Enter data offline

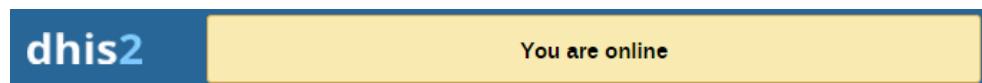

The **Data Entry** app works even if you don't have a stable Internet connection during data entry. When you don't have an internet connection, the data you enter is saved to your local computer. When the Internet connection is back, the app will push the data to the server. The total bandwidth usage is reduced since data entry forms no longer are retrieved from the server for each rendering.

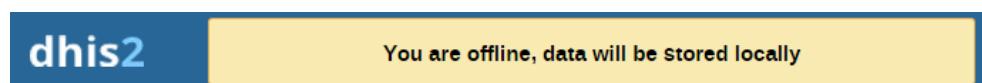

### Note

To use this functionality, you must login to the server while you've an Internet connection.

- When you're connected to the Internet, the app displays this message at the top of the data entry form:

- If your Internet connection breaks during data entry, the app detects it and displays this message:

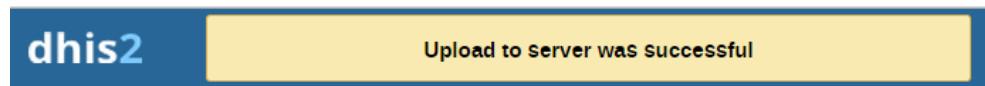

Now your data will be stored locally. You can continue to enter data as normal.

- Once you have entered all necessary data and the app detects that the Internet connection is back, you'll see this message:

Click **Upload** to synchronize data with the server.

- When the data has successfully synchronized with the server, you'll see this confirmation message:

## 4.9. Enable multi-organisation unit data entry

		BCG doses given				Fully Immunized child				LLITN g	
		Fixed		Outreach		Fixed		Outreach		Fixed	
		<1y	>1y	<1y	>1y	<1y	>1y	<1y	>1y	<1y	>1y
Ngelelun CHC		12	23	23	23	7	23				
Njandama MCHP		14									

		Children getting therapeutic feeding				Children supplied with food supplements				Mebendazole/Albendazole	
		Fixed		Outreach		Fixed		Outreach		Fixed	
		<1y	>1y	<1y	>1y	<1y	>1y	<1y	>1y	<1y	>1y
Ngelelun CHC		8	16	123							14
Njandama MCHP											12

[Complete](#) [Incomplete](#) | [Run validation](#)

It can be useful to enter data for multiple organisation units in the same data entry form, for instance if there are few data elements in the form and a huge number of organisation units in the hierarchy. In that case, you can enable multi-organisation unit data entry.

### Note

Multi-organisation unit data entry only works for section forms.

- Open the **System Settings** app.
- Select **Enable multi-organisation unit forms**.
- In the **Data Entry** app, select the organisation unit immediately above the organisation unit you want to enter data for in the organisation unit hierarchy.

Data elements will appear as columns and organisation units as rows in the form.

### Note

The data entry forms should still be assigned to the facilities that you actually enter data for, that is the organisation units now appearing in the form.

# Chapter 5. Using the Event Capture app

## 5.1. About the Event Capture app

## Event capture

Registering unit	Njandera MCHP			
Program	Inpatient mortality and mortality			
<b>Registered events (Total: 94)</b>				
Incident date	Age (Years)	Mode of Discharge	Diagnosis (ICD-10)	Comment
2015-10-22	35	Discharged	F60 Schizoid personality disorder	
2015-10-14	53	Discharged	A360 Pharyngeal spasmia	0
2015-07-14	52	Died	X20 Contact with unspecified venomous animal or plant, sports and athletics areas	
2015-07-05	7	Died	C28 Other congenital malformations of circulatory system	
2015-06-17	40	Absconded	B06 Rubella with other complications	
2015-05-25	59	Absconded	D19 Intrathoracic organ, unspecified	
2015-05-16	64	Died	V83 Passenger of special industrial vehicle injured in traffic accident	
2015-01-17	3	Absconded	Q610 Congenital lesioning of femur	
2014-12-15	25	Died	P374 Other congenital malacia	
2014-07-25	29	Transferred	J085 Other specified respiratory disorders	

No. of pages: 10      No. of rows per page: 10      Jump to page: 1

In the **Event Capture** app you register events that occurred at a particular time and place. An event can happen at any given point in time. This stands in contrast to routine data, which can be captured for predefined, regular intervals. Events are sometimes called cases or records. In DHIS2, events are linked to a program. The **Event Capture** app lets you select the organisation unit and program and specify a date when a event happened, before entering information for the event.

The **Event Capture** app works online and offline. If the Internet connectivity drops, you can continue to capture events. The events will be stored locally in your web browser (client). When connectivity has returned, the system will ask you to upload the locally stored data. The system then sends the data to the server where the data is stored.

## Note

If you close the web browser while in offline mode, it is not possible to reopen a new web browser window and continue the working session. However the data will still be saved locally and can be uploaded to the server the next time the machine is online and the you have logged into the server.

- You only see programs associated with the organisation unit you've selected and programs you've access to view through your user role.
  - Both skip-logic and validation error/warning messages are supported during registration.
  - When you close an organisation unit, you can't register or edit events to this organisation unit in the **Event Capture** app. You can still view and filter the event list and view the details of an event.
  - On-the-fly indicator expression evaluation is supported. If a program has indicators defined for it and the moment all values related to the indicator expression are filled, the system will calculate indicator and display the result.

- **Sorting:** this can be done by clicking the sorting icon of each column header. A red sorting icon implies the current sorting column. However, the sorting functionality works only within the page displayed. Currently, it is not possible to do sorting from serverside.
- **Filtering:** this is done by clicking the small search icon shown to the right of each column header. Clicking them provides an input field to type a filtering criteria. The system starts applying the filter the moment a user starts to type. During filtering it is possible to define start and end dates for date type data elements and lower and upper limits for number types. Server side filtering is not-support at the moment.

## 5.2. Register an event

1. Open the **Event Capture** app.
2. Select an organisation unit.
3. Select a program.

You'll only see programs associated with the selected organisation unit and programs you've access to through your user role.

4. Click **Register event**.
5. Select a date.
6. Fill in the required information.

If the program's program stage is configured to capture GPS coordinate, you can enter the coordinates in two ways:

- Enter values directly in corresponding fields.
- Choose a location in a map. The map option also displays polygons and points that are defined for organisation units.

7. Click **Save and add new** or **Save and go back**.

## 5.3. Edit an event

1. Open the **Event Capture** app.
2. Select an organisation unit.
3. Select a program.

All events registered to the selected program show up in a list.

4. Click the event you want to modify and select **Edit**.

5. Modify the event details and click **Update**.

## 5.4. Edit events in grid

The **Edit in grid** function allows you to edit a selected event within the table but only those columns (data elements) visible in the grid. If you need more columns, use **Show/hide columns** to specify which columns should be displayed in the list.

1. Open the **Event Capture** app.
2. Select an organisation unit.
3. Select a program.

All events registered to the selected program show up in a list.

4. Click the event you want to modify and select **Edit in grid**.
5. Modify the event details.
6. Click on another event to close the edit mode.

## 5.5. Share events in edit mode

You can share an event in edit mode via its web address.

1. Open the **Event Capture** app.
2. Open the event you want to share in edit mode.
3. Copy the URL.

Make sure that the URL contains "event" and "ou" (organisation unit) parameters.

4. Paste the URL in the sharing method of your choice, for example an e-mail or a message within DHIS2.

If you're not logged in to DHIS2 when you click the link, you'll be asked to do so and then taken to the dashboard.

## 5.6. View an event audit history

1. Open the **Event Capture** app.
2. Select an organisation unit.
3. Select a program.

All events registered to the selected program show up in a list.

4. Click an event and select **Audit history**.

## 5.7. Delete an event

1. Open the **Event Capture** app.
2. Select an organisation unit.
3. Select a program.

All events registered to the selected program show up in a list.

4. Click an event and select **Remove**.
5. Click **Remove** to confirm the deletion.

## 5.8. Modify an event list's layout

You can select which columns to show or hide in an event list. This can be useful for example when you have a long list of data elements assigned to a program stage. Once you've modified the layout, it's saved on your user profile. You can have different layouts for different programs.

1. Open the **Event Capture** app.
2. Select an organisation unit.
3. Select a program.

All events registered to the selected program show up in a list.

4. Click the **Show/hide columns** icon.
5. Select the columns you want to display and click **Close**.

## 5.9. Print an event list

1. Open the **Event Capture** app.
2. Select an organisation unit.
3. Select a program.

All events registered to the selected program show up in a list.

4. Click **Print list**.

## 5.10. Download an event list

1. Open the **Event Capture** app.
2. Select an organisation unit.
3. Select a program.

All events registered to the selected program show up in a list.

4. Click the **Download** icon and select a format.

You can download an event list in XML, JSON or CSV formats.

# Chapter 6. Using the Tracker Capture app

## 6.1. About the Tracker Capture app

The screenshot shows the DHIS2 interface for the 'TB program'. On the left, there's a navigation tree for 'Sierra Leone' with various districts like Bo, Badja, Ngeluhun CHC, etc. The main area is titled 'Tracker capture' and shows a table of TEIs. The table has columns for 'Registering unit', 'First name', 'Last name', and 'Gender'. There are 2797 total entries. The first few rows show data for Weima CHC, Haben, Saare, Male; Kamaranika CHC, Helen, Abhra, Female; Moyowa MCHP, Alem, Kinfe, Male; and Deima MCHP, Sebhat, Awet, Male.

Registering unit	First name	Last name	Gender
Weima CHC	Ermias	Yusef	Male
Kamaranika CHC	Haben	Saare	Female
Moyowa MCHP	Helen	Abhra	Female
Deima MCHP	Alem	Kinfe	Male
Dankawalle MCHP	Sebhat	Awet	Male
Mamboma (Peje Bongre) CHP	Michael	Nash	Male
Kamagbewu MCHP	Hyiab	Futsum	Female
Needy CHC	Eilsa	Gebre	Female
Mogbuama MCHP	Furuta	Kifle	Female
Thompson Bay MCHP	Ghenet	Alem	Female
Kiampakakolo MCHP	Huriyyah	Alem	Female
Bapuya MCHP	Sayid	Girma	Male

The **Tracker Capture** app is an advanced version of the **Event Capture** app.

- **Event Capture:** handles single events *without* registration
- **Tracker Capture:** handles multiple events (including single event) *with* registration.
- You capture event data for a registered tracked entity instance (TEI).
- You only see programs associated with the organisation unit you've selected and programs you've access to view through your user role.
- The options you see in the search and register functions depend on the program you've selected. The program attributes control these options. The attributes also decide the column names in the TEI list.

If you don't select a program, the system picks default attributes.

- Both skip-logic and validation error/warning messages are supported during registration.
- When you close an organisation unit, you can't register or edit events to this organisation unit in the **Tracker Capture** app. You can still search for TEIs and filter the search results. You can also view the dashboard of a particular TEI.

## 6.2. About tracked entity instance (TEI) dashboards

The screenshot shows a TEI dashboard for a woman named Sarah Thompson. The dashboard is divided into several sections:

- Enrollment:** Shows the enrolling organization (Ngelahun CHC), date of enrollment (2014-08-31), and LMP Date (2014-08-31). Buttons for "Complete", "Terminate", and a warning icon are present.
- Indicators:** Displays a message: "No indicator to show".
- Data Entry:** Shows a grid of visit types and dates: ANC 1st visit (Ngelahun CHC, 2014-11-30), ANC Visit (2-4+) (Ngelahun CHC, 2015-08-20), Delivery (Ngelahun CHC, 2015-04-23), and PNC Visit (Ngelahun CHC, 2015-08-20). A "Click for more" link is visible for each row.
- Report:** Shows the report type: MNCH / PNC (Adult Woman).
- Notes:** A placeholder for adding new notes.
- Profile | Edit:** Contains fields for First name (Sarah), Last name (Thompson), Email (sarah@gmail.com), Date of birth (2001-01-01), Address (Main street 1), Weight in kg (56), Height in cm (167), and Service provider (dU2P0v6JDco).
- Active programs:** States "No active program other than selected".
- Relationships | Add child | Add:** A table for managing relationships, showing one entry for a Child named Alan Thompson.

You manage a TEI from the TEI's dashboard in the **Tracker Capture** app.

- The dashboard consist of widgets. Drag and drop the widgets to place them in the order and in the position you want.
- Click the pin icon to stick the right column of widgets to a fix position. This is useful especially during data entry.

### Example 6.1.

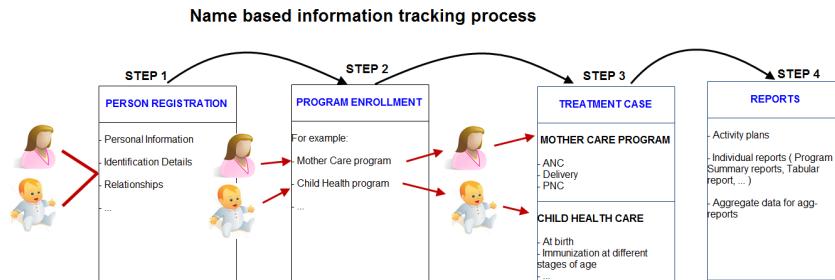

If you have many data elements or big form to fill in, stick the right widget column. Then all the widgets you've placed in the right column remain visible while you scroll in the data entry part.

- Any indicator defined for the program you've selected will have its value calculated and displayed in the **Indicators** widget.
- Navigation:
  - **Back:** takes you back to the search and registration page
  - Previous and next buttons: takes you to the previous or next TEI dashboard in the TEI search results list
  - **Other programs** field: if the TEI is enrolled in other programs, they're listed here. Click a program to change the program for which you enter data for the selected TEI. When you change programs, the content in the widgets change too.

## 6.3. Workflow

### Example 6.2.

Working process of Mother and child health program

### 1. Create new or find existing TEI.

You can search on defined attributes, for example name or address.

2. Enroll TEI in a program.
3. Based on the services of the program by the time, the app creates an activity plan for the TEI.
4. The TEI is provided with various services depending on the program. All services are recorded.
5. Use information about the individual cases to create reports.

## 6.4. Create a TEI

1. Open the **Tracker Capture** app.
2. In the organisation unit tree in the left hand pane, select an organisation unit.
3. Verify that the **Program** field is empty.
4. Click **Register**.
5. Select an entity type.
6. Fill in the required information.
7. Click **Save and continue** or **Save and add new**.
  - **Save and continue**: completes the registration and opens the registered TEI's dashboard
  - **Save and add new**: completes the registration but stays on the same page. Use this option when you want to register one TEI after another without enrollment to a program.

### Note

For unique tracked entity attributes the system can automatically generate and assign numeric IDs. When registering tracked entity instances on web, the registration form will then automatically be populated with a number in the given pattern. On Android, the ID generation is used to reserve a series of IDs for each Android device. This allows offline registration of tracked entity instances without risking duplicate IDs when syncing with the server.

You configure automated IDs in the **Maintenance** app: **Tracker > Tracked entity attribute**.

## 6.5. Create a TEI and enroll it in a program

You can create a TEI and enroll that TEI to a program in one operation:

1. Open the **Tracker Capture** app.
2. In the organisation unit tree in the left hand pane, select an organisation unit.
3. Select a program.
4. Click **Register**.

5. Fill in the required information.
6. Click **Save and continue** or **Save and add new**.
  - **Save and continue**: completes the registration and opens the registered TEI's dashboard
  - **Save and add new**: completes the registration but stays on the same page. Use this option when you want to register and enroll one TEI after another without enter data.

## 6.6. Open an existing TEI dashboard

There are two ways to find a TEI: simple and advanced search. You can also modify the search results list's layout and download the search results list in several formats.

### Example: searching/registration

Person Search		(Total: 63)
First name	Last name	
Yusef	Gebre	
Dahlik	Selam	
Halle	Rezene	
Adonay	Goytrom	
Robel	Temesgen	
Awet	Yohannes	
Haylom	Saare	
Gimja	Fesahaye	
Abraha	Iggi	
Nefalem	Ethem	
Makda	Dahlik	
Sabu	Osman	
Massawa	Fethaw	
Nuguse	Elias	
Filmon	Abraha	
Samuel	Wele	
Shukriya	Goytrom	
Nuguse	Biriam	Male 886602646
Natsnet	Habte	Female 84024605
Mesran	Gabriel	Female 436816713
Mhet	Shesty	Female 295881991

### 6.6.1. Simple TEI search

1. Open the **Tracker Capture** app.
2. (Optional) In the organisation unit tree in the left hand pane, select an organisation unit, then a program.
3. In the right hand search field, type your search criteria.

The search criteria could for example be a last name. You can search on all TEI attributes.

4. Click the **Search** icon.

A list of TEIs that match your search criteria displays.

5. If you have selected a program, you can filter the search results based on enrollment status:
  - **Only those with active enrollment**
  - **Only those with completed enrollment**
  - **Only those with cancelled enrollment**

6. Click a TEI.

The TEI dashboard opens.

### 6.6.2. Advanced TEI search

Advanced search is conducted for the organisation units you select in the organisation tree inside the **Advanced search** window. The left-hand side organisation tree is generated based on your assigned organisation units. So in the **Advanced search** window you can select organisation units outside your own organisation unit.

1. Open the **Tracker Capture** app.
2. (Optional) In the organisation unit tree in the left hand pane, select an organisation unit, then a program.

If a program is selected, advanced search allows you to search on the incident date if the program has one.
3. In the right hand search field, click the **Advanced search** arrow.

An expanded search form opens.
4. Enter your search criteria(s).
  - **Organisation unit:** The tree displayed here depends on your user role. If the you have role "Search Tracked Entity Instance in All Org Units" or "ALL", a tree with all available organisation units is provided. Otherwise the tree displayed in advanced search is the same as the one on the left-hand side.
  - You can select the scope of the organisation unit search. In the **Organisation unit scope** section select **Selected**, **Immediate children** or **All children**.
  - **Date or enrollment:** appears if you have selected a program

#### 5. Click **Search**.

A list of TEIs that match your search criteria(s) displays.

6. If you have selected a program, you can filter the search results based on enrollment status:
  - **Only those with active enrollment**
  - **Only those with completed enrollment**
  - **Only those with cancelled enrollment**

#### 7. Click a TEI.

The TEI dashboard opens.

### 6.6.3. Find a TEI outside your organisation unit

You can search for a TEI from another organisation unit, outside your assigned organisation units. To do this:

- Your user role must have "Search Tracked Entity Instance in All Org Units" or "ALL" assigned to it.
- You must select another organisation unit than your own in the organisation unit tree in the **Advanced search** window.

### 6.6.4. Download TEI search results list

1. Create a TEI search results list.
2. Click **Download as** and select a format:
  - XML
  - JSON
  - CSV

### 6.6.5. Modify TEI search results list's layout

You can select which columns to show or hide in a TEI search result list. Once you've modified the layout, it's saved on your user profile. You can have different layouts for different programs.

1. Create a TEI search results list.
2. Click **Show/hide columns**.

3. Select the columns you want to display and click **Close**.

## 6.7. Enroll an existing TEI in a program

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3. Select a program.
4. In the **Enrollment** widget, click **Add new**.
5. Fill in the required information and click **Enroll**.

## 6.8. Enter event data for a TEI

In a TEI dashboard, you enter event data in the **Timeline Data entry** or **Tabular data entry** widgets.

**Table 6.1. Data entry widgets in the Tracker Capture app**

Widget name	Description
<b>Timeline Data entry</b>	<p>For data entry using either default or custom forms.</p> <p>Depending on program definition, in particular program stages, events will be displayed in a timely fashion. Clicking on any of them displays the corresponding data entry. If a stage needs new event, a plus icon is displayed for new event creation. To proceed with data entry, it is mandatory to have event date. Once an event date is specified it is not possible to change due date. The assumption is that by specifying event date, the event has already taken place. If the event hasn't occurred yet, it is possible to change due date - this is effectively doing nothing but rescheduling. The buttons at the bottom help to change the status of a selected event.</p> <p>Another key feature from this widget is addition of multiple notes for an event. Normally data recording is through data elements, however there are cases where it is necessary to record additional information or comments. This is where the notes section comes handy. However it is not possible to delete a note. The idea is notes are more like log books. Both skip-logic and validation error/warning messages are supported during data entry.</p>
<b>Tabular data entry</b>	<p>For tabular-style data entry.</p> <p>The widget displays the list of program stages as left-hand side labels. Events will be listed in table for repeatable program stage, and allows for in-line edits of event data values.</p>

## 6.9. Manage a TEI's enrollments

### 6.9.1. Deactivate a TEI's enrollment

If you deactivate a TEI dashboard, the TEI becomes 'read-only'. You can't enter data, enroll the TEI or edit the TEI's profile.

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3. In the **Enrollment** widget, click **Deactivate**.
4. Click **Yes** to confirm.

### 6.9.2. Activate a TEI's enrollment

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3. In the **Enrollment** widget, click **Activate**.
4. Click **Yes** to confirm.

### 6.9.3. Mark TEI's enrollment as complete

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3. In the **Enrollment** widget, click **Complete**.
4. Click **Yes** to confirm.

### 6.9.4. Reopen completed enrollment

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3. In the **Enrollment** widget, click **Reopen**.
4. Click **Yes** to confirm.

### 6.9.5. Display TEI's enrollment history

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3. In the **Profile** widget, click the **Audit history** icon.

### 6.9.6. Create a TEI enrollment note

An enrollment note is useful to record information about for example why an enrollment was cancelled.

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3. In the **Notes** widget, type your note and click **Add**.

## 6.10. Send a message to a TEI

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.

3. In the **Messaging** widget and select **SMS** or **E-mail**.

4. Enter the required contact information.

If the TEI's profile contains an e-mail address or a phone number, these fields are filled in automatically.

5. Type a message.

6. Click **Send**.

## 6.11. Mark a TEI for follow-up

You can use mark a TEI's enrollment for follow-up and then use this status as a filter when you create **Upcoming events** and **Overdue events** reports. This can be useful for example to monitor high-risk cases during a pregnancy program.

1. Open the **Tracker Capture** app.

2. Open an existing TEI dashboard.

3. In the **Enrollment** widget, click the **Mark for follow-up** icon.

## 6.12. Edit a TEI's profile

You edit a TEI's profile or tracked entity attributes in the **Profile** widget.

1. Open the **Tracker Capture** app.

2. Open an existing TEI dashboard.

3. In the **Profile** widget, click **Edit**.

4. Modify the profile and click **Save**.

## 6.13. Add a relationship to a TEI

You can create a relationship from one TEI to another, for example linking a mother and a child together or a husband and a wife. Depending on how the relationship type is configured, the relative can inherit attributes.

### Example 6.3. Mother-Child relationship

Assume there are two programs: Antenatal care for the mother and Immunization for the child. If first name, last name and address attributes are required for both programs, it is possible to configure last name and address attributes as inheritable. Then during child registration, there is no need to enter these inheritable attributes. You can add them automatically based on the mother's value. If you want to have a different value for the child, you can override the automatically generated value.

1. Open the **Tracker Capture** app.

2. Open an existing TEI dashboard.

3. In the **Relationships** widget, and click **Add**.

4. Select a relationship type.

5. Search for the relative and select it.

6. Click **Save**.

## 6.14. Share a TEI dashboard

You can share a TEI dashboard via its web address.

1. Open the **Tracker Capture** app.
2. Open the dashboard you want to share.
3. Copy the URL.

Make sure that the URL contains "tei", "program" and "ou" (organisation unit) parameters.

4. Paste the URL in the sharing method of your choice, for example an e-mail or a message within DHIS2.

If you're not logged in to DHIS2 when you click the link, you'll be asked to do so and then taken to the dashboard.

## 6.15. Deactivate a TEI

If you deactivate a TEI, the TEI becomes 'read-only'. Data associated with the TEI is not deleted.

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3.  
In the top right corner, click the  button > **Deactivate**.
4. Click **Yes** to confirm.

## 6.16. Activate a TEI

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3.  
In the upper top corner, click the  button > **Activate**.
4. Click **Yes** to confirm.

## 6.17. Delete a TEI

### **Warning**

When you delete a TEI, you delete all data associated with the TEI.

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3.  
In the top right corner, click the  button > **Delete**.

4. Click **Yes** to confirm.

## 6.18. Configure the TEI dashboard

### 6.18.1. Show or hide widgets

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3. Click the **Settings** icon, and select **Show/hide widgets**.
4. Select the widgets you want to show or hide.
5. Click **Close**.

### 6.18.2. Save the dashboard's layout as default

You can save the dashboard's layout as default for a program.

1. Open the **Tracker Capture** app.
2. Open an existing TEI dashboard.
3. Click the **Settings** icon, and select **Save dashboard layout as default**.

## 6.19. Create reports

1. Open the **Tracker Capture** app.
2. Click **Reports**.
3. Select a report type.

**Table 6.2. Report types in the Tracker Capture app**

Report type	Description
Program summary	A summary report for a particular program, organisation unit and time frame. The report consist of a list of TEIs and their records organised based on program stages.
Program statistics	A statistics report for a particular program. The report provides for example an overview of drop-outs or completion rates in a given time frame at a particular organisation unit.
Upcoming events	A tabular report showing tracked entity instances and their upcoming events for a selected program and time. You can sort the columns and search the values. Show/hide operations are possible on the columns. You can also export the table to Microsoft Excel.
Overdue events	A list of events for a selected program. The report displays a list of TEIs and their events that are not completed on time. You can sort the columns and search the values. You can also export the table to Microsoft Excel.

## Example 6.4. Program summary report

**Program Summary Report**

Organisation unit: Ngelelun CHC

Organisation unit scope: Selected

Program: MNCH / PNC (Adult Woman)

Person	Event date	Organisation unit	mnch ANC Visit	mnch Weight (g)	mnch Blood Pressure	mnch HB	mnch Tetatus
<b>First name:</b> Evelyn <b>Last name:</b> Jackson	2015-01-01	Ngelelun CHC					
	2015-03-10	Ngelelun CHC	4				
	2015-04-08	Ngelelun CHC					
	2015-04-15	Ngelelun CHC	3				
<b>First name:</b> Woman2 <b>Last name:</b> Woman2	2015-03-25	Ngelelun CHC		10	40		
<b>First name:</b> Baby name <b>Last name:</b> Father name	2015-03-17	Ngelelun CHC					
	2015-04-16	Ngelelun CHC					

The summary report displays a list of TEIs and their records for "MNCH/PNC (Adult Woman)" program. The records are organized in the form of tabs where each tab is a program stage. The columns in the table are data elements which are configured to be displayed in reports under program stage definition.

# Chapter 7. Analyze data in pivot tables

## 7.1. About the Pivot Table app

With the **Pivot Table** app, you can create pivot tables based on all available data dimensions in DHIS2. A pivot table is a dynamic tool for data analysis which lets you summarize and arrange data according to its dimensions. Examples of data dimensions in DHIS2 are:

- data dimension itself (for example data elements, indicators and events)
- periods (representing the time period for the data)
- organisation hierarchy (representing the geographical location of the data)

From these dimensions you can freely select *dimension items* to include in the pivot table. You can create additional dimensions in DHIS2 with the group set functionality. This allows for different aggregation pathways, such as aggregation by "Partner" or facility type.

A pivot table can arrange data dimensions on *columns*, *rows*, and as *filters*. When you place a data dimension on columns, the pivot table will display one column per dimension item. If you place multiple data dimensions on columns, the pivot table displays one column for all combinations of the items in the selected dimensions. When you place a data dimension on rows, the pivot table displays one row per dimension item in a similar fashion. The dimensions you select as filters will not be included in the pivot table, but will aggregate and filter the table data based on the selected filter items.

### Constraints and tips

- You must select at least one dimension on columns or rows.
- You must include at least one period.
- Data element group sets and reporting rates can't appear in the same pivot table.
- A pivot table can't contain more than the maximum number of analytic records which have been specified in the system settings. The maximum number of records could also be constrained by the maximum RAM which is available to your browser. Consider making smaller tables instead of one table which displays all of your data elements and indicators together.
- The **Pivot Table** app supports drill-down and up for periods and organisation unit. This means that you can for example drill down from yearly periods to quarters, months and weeks inside a pivot table. You can also drill down from the global organisation unit to countries, provinces and facilities.

## 7.2. Create a pivot table

1. Open the **Pivot Table** app.
2. In the menu to the left, select the dimension items you want to analyse, for example data elements or indicators.
3. Click **Layout** and arrange the data dimensions as columns, rows and filters.

You can keep the default selection if you want.

4. Click **Update**.

### **Example 7.1. Example pivot table with data elements as columns and periods as rows.**

In this example, indicators are listed as columns and periods as rows.

Periods / Data	BCG doses given	Fully Immunized child	Measles doses given	OPV3 doses given	Penta3 doses given	Total
October 2014	16 691	14 065	15 763	14 006	14 106	74 631
November 2014	17 400	14 812	16 679	15 866	16 034	80 791
December 2014	13 634	11 743	11 798	10 292	10 812	58 279
January 2015	20 031	14 579	16 379	14 446	14 646	80 081
February 2015	20 483	15 732	18 208	15 992	16 245	86 660
March 2015	19 396	16 200	17 563	15 304	15 600	84 063
April 2015	20 410	15 526	17 422	15 335	15 790	84 483
May 2015	22 402	17 765	19 386	16 711	17 191	93 455
June 2015	23 243	15 762	17 875	16 143	16 601	89 624
July 2015	21 589	15 705	17 063	16 741	16 622	87 720
August 2015	20 485	17 499	19 144	18 024	18 247	93 399
September 2015	21 130	17 841	19 645	17 924	18 108	94 648
Total	236 894	187 229	206 925	186 784	190 002	1 007 834

## 7.2.1. Select dimension items

The left menu lists sections for all available data dimensions. From each section you can select any number of dimension items. As an example, you can open the section for data elements and select any number of data elements from the available list. You can select an item by marking it and clicking on the arrow in the section header or simply double-clicking on the item. Before you can use a data dimension in your pivot table you must at least select one dimension item. If you arrange a dimension as columns or rows but do not select any dimension items, the dimension is ignored.

You must choose at least one data dimension type to create a pivot table. The available types are described in this table:

**Table 7.1. Data dimension types**

Data dimension type	Definition	Examples
Indicators	An indicator is a calculated formula based on data elements.	Coverage of immunization across a specific district.
Data elements	Represents the phenomenon for which data has been captured.	Number of malaria cases; number of BCG doses given.
Data sets	<p>A collection of data elements grouped for data collection. You can select :</p> <ul style="list-style-type: none"> <li>• <b>Reporting rates:</b> the percentage of actual reports compared to the expected number of reports</li> <li>• <b>Reporting rates on time:</b> the reporting rates based on timely form submissions. A timely submission must happen within a number of days after the reporting period.</li> <li>• <b>Actual reports:</b> the actual number of reports</li> <li>• <b>Actual reports on time:</b> the actual number of reports based on timely form submissions. A timely submission must happen</li> </ul>	Reporting rates for immunization and morbidity forms.

Data dimension type	Definition	Examples
	<p>within a number of days after the reporting period.</p> <ul style="list-style-type: none"> <li>• <b>Expected reports:</b> the number of expected reports based on organisation units where the data set and the reporting frequency has been assigned.</li> </ul>	
Event data items	A data element that is part of a program representing events that have been captured.	Average weight and height for children in a nutrition program.
Program indicators	A calculated formula based on data elements in a program representing events.	Average BMI score for children in a nutrition program.

You can combine these dimensions to display for example aggregate data with reporting rates, or event data items together with program indicators, all in the same pivot tables. For the "data element" data dimension, you are also able to select "Totals" and "Details", which will allow you to view different category combination options together on the same pivot table.

For the period dimension you can choose between using fixed periods or relative periods. An example of a fixed period is "January 2012". To select fixed periods start by selecting a period type from the period type list. You can then select periods from the list of available periods.

Relative periods are periods relative to the current date. Examples of relative periods are "Last month", "Last 12 months", "Last 5 years". Relative periods can be selected by ticking the checkboxes next to each period. The main advantage of using relative periods is that when you save a pivot table favorite, it will stay updated with the latest data as time goes by without the need for constantly updating it.

For the organisation unit dimension you can select any number of organisation units from the hierarchy. To select all organisation units below a specific parent organisation unit, right click and click "Select all children". To manually select multiple organisation units, click and hold the **Ctrl** key while clicking on organisation units. You can tick "User org unit", "User sub-units" or "User sub-x2-units" in order to dynamically insert the organisation unit or units associated with your user account. This is useful when you save a pivot table favorite and want to share it with other users, as the organisation units linked with the other user's account will be used when viewing the favorite.

## Selection of fixed and relative periods.

Dynamic dimensions can consist of organisation unit group sets, data element group sets, or category option group sets which have been configured with the type of "Disaggregation". Once the group sets have been configured, they will be come available in the pivot tables, and can be used as additional analysis dimensions, for instance to analyse aggregate data by Type of organisation unit or Implementing partner. Dynamic dimensions work the same as fixed dimensions.

### Tip

Some dynamic dimensions may contain many items. This can cause issues with certain browsers due to the length of the URL when many dimension members are selected. A special "All" check box is available for dynamic dimensions, which allows you to include all available dimensions implicitly in your pivot table, without specifying each and every dimension member.

## 7.2.2. Modify pivot table layout

After selecting data dimensions it is time to arrange your pivot table. Click "Layout" in the top menu to open the layout screen. In this screen you can position your data dimensions as table columns, rows or filters by clicking and dragging the dimensions from the dimensions list to the respective column, row and filter lists. You can set any number of dimensions in any of the lists. For instance, you can click on "Organisation units" and drag it to the row list in order to position the organisation unit dimension as table rows. Note that indicators, data elements and data set reporting rates are part of the common "Data" dimension and will be displayed together in the pivot table. For instance, after selecting indicators and data elements in the left menu, you can drag "Organisation Unit" from the available dimensions list to the row dimension list in order to arrange them as rows in the pivot table.

### The table layout screen.

The screenshot shows the 'Table layout' interface. It has three main sections: 'Excluded dimensions' (containing 'Assigned categories', 'Facility Ownership', 'Funding Agency', and 'Gender'), 'Report filter' (empty), and 'Column dimensions' (containing 'Data'). Below these are two rows: 'Row dimensions' (containing 'Periods' and 'Organisation units') and 'Report filter' (empty). At the bottom right are 'Hide' and 'Update' buttons.

After you have set up your pivot table you can click "Update" to render your pivot table, or click "Hide" to hide the layout screen without any changes taking effect. Since we in our example have selected both the period and organisation unit dimension as rows, the pivot table will generate all combinations of the items in these dimensions and produce a table like this:

### Pivot table where organisation units and periods are repeated on rows.

The screenshot shows a pivot table with the following structure:

	Periods	Organisation units / Data	BCG doses given	Fully Immunized child	Measles doses given	OPV3 doses given	Penta3 doses given	Total
June 2015	Bo	2 405	1 427	1 512	1 535	1 544	8 423	
	Bombali	1 585	1 168	1 228	1 183	1 200	6 364	
	Bonthe	779	472	515	541	534	2 841	
	4 769	3 067	3 255	3 259	3 278	17 628		
July 2015	Bo	2 255	1 351	1 382	1 559	1 492	8 039	
	Bombali	1 438	1 219	1 252	1 300	1 303	6 512	
	Bonthe	650	597	623	593	560	3 023	
	4 343	3 167	3 257	3 452	3 355	17 574		
August 2015	Bo	2 283	2 092	2 148	2 127	2 073	10 723	
	Bombali	1 613	1 255	1 332	1 318	1 318	6 836	
	Bonthe	792	621	650	641	667	3 371	
	4 688	3 968	4 130	4 086	4 058	20 930		
September 2015	Bo	2 392	1 508	2 067	1 732	1 737	9 436	
	Bombali	1 526	1 344	1 432	1 337	1 403	7 042	
	Bonthe	615	792	684	622	651	3 364	
	4 533	3 644	4 183	3 691	3 791	19 842		
	Total	18 333	13 846	14 825	14 488	14 482	75 974	

### 7.3. Change the display of your pivot table

1. Open the **Pivot Table** app.
2. Create a new pivot table or open a favorite.
3. Click **Options**.

4. Set the options as required.

**Table 7.2. Pivot table options**

<b>Option</b>		<b>Description</b>
<b>Data</b>	<b>Show column totals</b>	Displays total values in the table for each row and column, as well as a total for all values in the table.
	<b>Show row totals</b>	
	<b>Show column sub-totals</b>	Displays subtotals in the table for each dimension.
	<b>Show row sub-totals</b>	If you only select one dimension, subtotals will be hidden for those columns or rows. This is because the values will be equal to the subtotals.
	<b>Show dimension labels</b>	Shows the dimension names as part of the pivot tables.
	<b>Hide empty rows</b>	Hides empty rows from the table. This is useful when you look at large tables where a big part of the dimension items don't have data in order to keep the table more readable.
	<b>Hide empty columns</b>	Hides empty columns from the table. This is useful when you look at large tables where a big part of the dimension items don't have data in order to keep the table more readable.
	<b>Skip rounding</b>	Skips the rounding of data values, offering the full precision of data values. Can be useful for finance data where the full dollar amount is required.
	<b>Aggregation type</b>	The default aggregation operator can be over-ridden here, by selecting a different aggregation operator. Some of the aggregation types are <b>Count</b> , <b>Min</b> and <b>Max</b> .
	<b>Number type</b>	Sets the type of value you want to display in the pivot table: <b>Value</b> , <b>Percentage of row</b> or <b>Percentage of column</b> .  The options <b>Percentage of row</b> and <b>Percentage of column</b> mean that you'll display values as percentages of row total or percentage of column total instead of the aggregated value. This is useful when you want to see the contribution of data elements,

<b>Option</b>	<b>Description</b>
	categories or organisation units to the total value.
<b>Events</b>	<b>Include only completed events</b> Includes only completed events in the aggregation process. This is useful for example to exclude partial events in indicator calculations.
<b>Organisation units</b>	<b>Show hierarchy</b> Shows the name of all ancestors for organisation units, for example "Sierra Leone / Bombali / Tamabaka / Sanya CHP" for Sanya CHP. The organisation units are then sorted alphabetically which will order the organisation units according to the hierarchy. When you download a pivot table with organisation units as rows and you've selected <b>Show hierarchy</b> , each organisation unit level is rendered as a separate column. This is useful for example when you create Excel pivot tables on a local computer.
<b>Legend</b>	<b>Apply legend</b> Applies a legend to the values. This mean that you can apply a colour to the values. Select <b>By data item</b> to color the table cells individually according to each data element or indicator. You configure legends in the <b>Maintenance</b> app.
	<b>Style</b> Colors the text or background of cells in pivot tables based on the selected legend. You can use this option for scorecards to identify high and low values at a glance.
<b>Style</b>	<b>Display density</b> Controls the size of the cells in the table. You can set it to <b>Comfortable</b> , <b>Normal</b> or <b>Compact</b> . <b>Compact</b> is useful when you want to fit large tables into the browser screen.
	<b>Font size</b> Controls the size of the table text font. You can set it to <b>Large</b> , <b>Normal</b> or <b>Small</b> .

Option	Description
	<b>Digit group separator</b> Controls which character to separate groups of digits or "thousands". You can set it to <b>Comma, Space or None</b> .
<b>General</b>	<b>Table title</b> Type a title here to display it above the table.
<b>Parameters (for standard reports only)</b>	 <b>Note</b> You create standard reports in the <b>Reports</b> app. In the <b>Pivot Table</b> app you set which parameters the system should prompt the user for.
	<b>Reporting period</b> Controls whether to ask user to enter a report period.
	<b>Organisation unit</b> Controls whether to ask user to enter an organisation unit.
	<b>Parent organisation unit</b> Controls whether to ask user to enter a parent organisation unit.
	<b>Include regression</b> Includes a column with regression values to the pivot table.
	<b>Include cumulative</b> Includes a column with cumulative values to the pivot table.
	<b>Sort order</b> Controls the sort order of the values.
	<b>Top limit</b> Controls the maximum number of rows to include in the pivot table.

5. Click **Update**.

## 7.4. Manage favorites

Saving your charts or pivot tables as favorites makes it easy to find them later. You can also choose to share them with other users as an interpretation or display them on the dashboard.

You view the details and interpretations of your favorites in the **Pivot Table**, **Data Visualizer**, **Event Visualizer**, **Event Reports** apps. Use the **Favorites** menu to manage your favorites.

### 7.4.1. Open a favorite

1. Click **Favorites > Open**.
2. Enter the name of a favorite in the search field, or click **Prev** and **Next** to display favorites.
3. Click the name of the favorite you want to open.

### 7.4.2. Save a favorite

1. Click **Favorites > Save as**.
2. Enter a **Name** and a **Description** for your favorite.
3. Click **Save**.

### 7.4.3. Rename a favorite

1. Click **Favorites > Rename**.
2. Enter the new name for your favorite.
3. Click **Update**.

### 7.4.4. Write an interpretation for a favorite

An interpretation is a link to a resource with a description of the data at a given period. This information is visible in the **Dashboard** app. To create an interpretation, you first need to create a favorite. If you've shared your favorite with other people, the interpretation you write is visible to those people.

1. Click **Favorites > Write interpretation**.
2. In the text field, type a comment, question or interpretation. You can see this information in the **Dashboard** app.
3. Search for a user group that you want to share your favorite with, then click the + icon.
4. Change sharing settings for the user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **None:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Share**.

### 7.4.5. Create a link to a favorite

1. Click **Favorites > Get link**.
2. Select one of the following:
  - **Open in this app:** You get a URL for the favorite which you can share with other users by email or chat.
  - **Open in web api:** You get a URL of the API resource. By default this is an HTML resource, but you can change the file extension to ".json" or ".csv".

### 7.4.6. Delete a favorite

1. Click **Favorites > Delete**.
2. Click **OK**.

### 7.4.7. View interpretations based on relative periods

To view interpretations for relative periods, such as a year ago:

1. Open a favorite with interpretations.
2. Click **>>>** in the top right of the workspace.
3. Click an interpretation. Your chart displays the data and the date based on when the interpretation was created. To view other interpretations, click them.

## 7.5. Download data from a pivot table

### 7.5.1. Download table layout data format

To download the data in the current pivot table:

1. Click **Download**.
2. Under **Table layout**, click the format you want to download: Microsoft Excel, CSV or HTML.

The data table will have one column per dimension and contain names of the dimension items.

### Tip

When you download a pivot table with organisation units as rows and you've selected **Show hierarchy** in **Table options**, each organisation unit level is rendered as a separate column. This is useful for example when you create Excel pivot tables on a local computer.

### Tip

You can create a pivot table in Microsoft Excel from the downloaded Excel file.

## 7.5.2. Download plain data source format

You can download data in the current pivot table in JSON, XML, Excel, and CSV as plain data formats with different identification schemes (ID, Code, and Name). The data document uses identifiers of the dimension items and opens in a new browser window to display the URL of the request to the Web API in the address bar. This is useful for developers of apps and other client modules based on the DHIS2 Web API or for those who require a plain data source, for instance for import into statistical packages.

To download plain data source formats:

1. Click **Download**.
2. Under **Plain data source**, click the format you want to download.

**Table 7.3. Available formats**

Format	Action	Description
JSON	Click <b>JSON</b>	Downloads JSON format based on ID property.  You can also download JSON format based on <b>Code</b> or <b>Name</b> property.
XML	Click <b>XML</b>	Downloads XML format based on ID property.  You can also download XML format based on <b>Code</b> or <b>Name</b> property.
Microsoft Excel	Click <b>Microsoft Excel</b>	Downloads XML format based on ID property.  You can also download Microsoft Excel format based on <b>Code</b> or <b>Name</b> property.
CSV	Click <b>CSV</b>	Downloads CSV format based on ID property.  You can also download CSV format based on <b>Code</b> or <b>Name</b> property.
JRXML	Put the cursor on <b>Advanced</b> and click <b>JRXML</b>	Produces a template of a Jasper Report which can be further customized based on

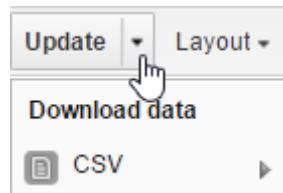

Format	Action	Description
		your exact needs and used as the basis for a standard report in DHIS2.
Raw data SQL	Put the cursor on <b>Advanced</b> and click <b>Raw data SQL</b>	Provides the actual SQL statement used to generate the pivot table. You can use it as a data source in a Jasper report, or as the basis for an SQL view.

### 7.5.3. Download a CSV format without rendering data in the web browser

You can download data in CSV format directly without rendering the data in the web browser. This helps to reduce any constraints in the system settings that has been set with regards to the maximum number of analytic records. This lets you download much larger batches of data that you can use for later offline analysis.

To download data in CSV format without first rendering data in the web browser:

1. Click the arrow beside **Update**.

2. Click **CSV** to download the format based on ID property.

The file downloads to your computer.

#### Tip

You can also download CSV format based on **Code** or **Name** property.

### 7.6. Embed a pivot table in an external web page

Certain analysis-related resources in DHIS2, like pivot tables, charts and maps, can be embedded in any web page by using a plug-in. You will find more information about the plug-ins in the Web API chapter in the *DHIS2 Developer Manual*.

To generate a HTML fragment that you can use to display the pivot table in an external web page:

1. Click **Embed**.
2. Click **Select** to highlight the HTML fragment.

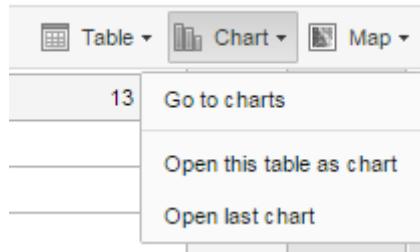

### 7.7. Visualize pivot table data as a chart or a map

When you have made a pivot table you can switch between pivot table, chart and map visualization of your data.

#### 7.7.1. Open a pivot table as a chart

1. Click **Chart > Open this table as chart**.

Your current pivot table opens as a chart.

### 7.7.2. Open a pivot table selection as a chart

If you want to visualize a small part of your pivot table as a chart you can click directly on a value in the table instead opening the whole table.

1. In the pivot table, click a value.

547	1 374	4 995	483
1 347	1 802	7 487	876
1 892	<b>Open selection as chart</b>		1 025
450	<b>Open selection as map</b>		279
463	885	3 385	542
1 700	1 643	6 852	587
28 157	27 208	124 892	9 660

2. To verify the selection, hold the cursor over **Open selection as chart**. The highlighted dimension headers in the table indicate what data will be visualized as a chart.

3. Click **Open selection as chart**.

### 7.7.3. Open a pivot table as a map

1. Click **Chart > Open this table as map**

Your current pivot table opens as a map.

### 7.7.4. Open a pivot table selection as a map

1. In the pivot table, click a value.

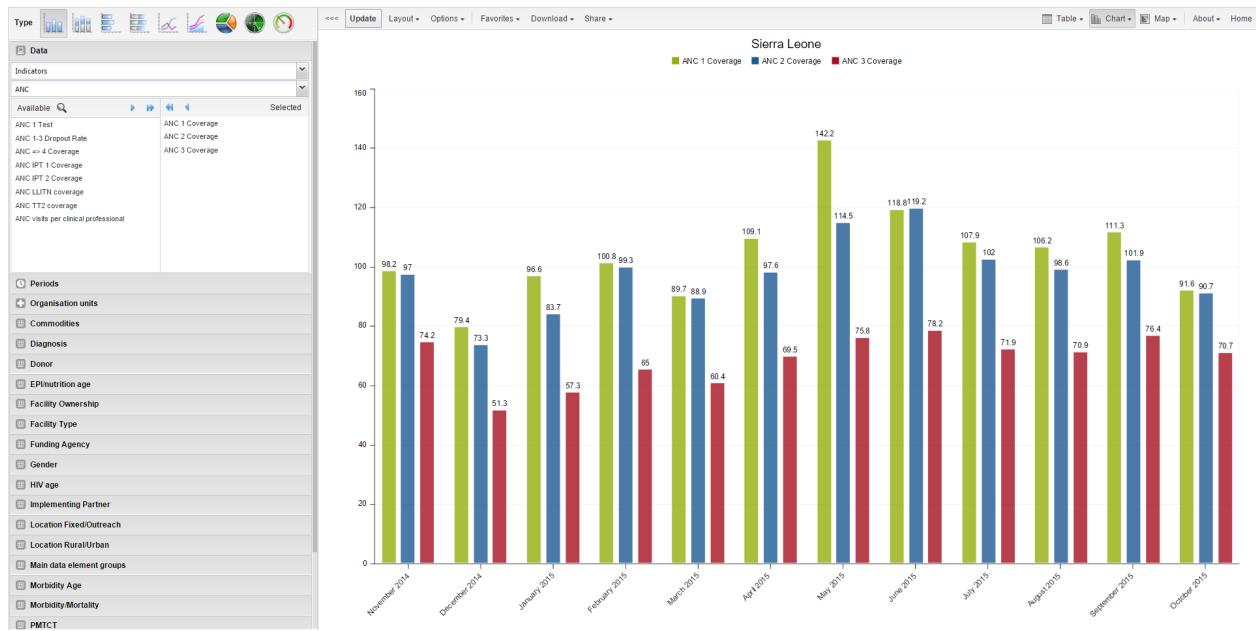

A menu displays.

2. Click **Open selection as map**.

Your selection opens as a map.

# Chapter 8. Using the Data Visualizer app

## 8.1. About the Data Visualizer app

With the **Data Visualizer** app, you can select content, for example indicators, data elements, periods and organisation units, for an analysis. The app works well over poor Internet connections and generates charts in the web browser.

## Constraints and tips

- Hide and show individual data series in the chart by clicking directly on the series label in the chart. They appear either at the top or to the right of the chart.
- Click the triple left-arrow button on the top centre menu. This collapses the left side menu and gives more space for the chart. You can get the menu back by clicking on the same button again.

## 8.2. Create a chart

1. Open the **Data Visualizer** app and select a chart type.
2. In the menu to the left, select the metadata you want to analyse. You must select one or more elements from all of the three dimensions - data (indicators, data elements, reporting rates), periods (relative, fixed) and organisation units (units or groups).

### Note

If you've access to the system settings, you can change the default period type under **General settings > Default relative period for analysis**.

**Last 12 Months** from the period dimension and the root organisation unit are selected by default.

3. Click **Layout** and arrange the dimensions.

You can keep the default selection if you want.

4. Click **Update**.

## 8.3. Select a chart type

The **Data Visualizer** app has nine different chart types, each with different characteristics. To select a chart type:

1. In **Chart type**, click the chart type you need.

**Table 8.1. Chart types**

Chart type	Description
Column chart	Displays information as vertical rectangular columns with lengths proportional to the values they represent.  Useful when you want to, for example, compare performance of different districts.
Stacked column chart	Displays information as vertical rectangular columns, where bars representing multiple categories are stacked on top of each other.  Useful when you want to, for example, display trends or sums of related data elements.
Bar chart	Same as column chart, only with horizontal bars.
Stacked bar chart	Same as stacked column chart, only with horizontal bars.
Line chart	Displays information as a series of points connected by straight lines. Also referred to as time series.  Useful when you want to, for example, visualize trends in indicator data over multiple time periods.
Area chart	Is based on line chart, with the space between the axis and the line filled with colors and the lines stacked on top of each other.  Useful when you want to compare the trends of related indicators.
Pie chart	Circular chart divided into sectors (or slices).  Useful when you want to, for example, visualize the proportion of data for individual data elements compared to the total sum of all data elements in the chart.
Radar chart	Displays data on axes starting from the same point. Also known as spider chart.
Speedometer chart	Semi-circle chart which displays values out of 100 %. Also referred to as a gauge chart.

2. Click **Update**.

## 8.4. Select dimension items

A dimension refers to the elements which describe the data values in the system. There are three main dimensions in the system:

- Data: Includes data elements, indicators and datasets (reporting rates), describing the phenomena or event of the data.
- Periods: Describes when the event took place.
- Organisation units: Describes where the event took place.

The Data Visualizer app lets you use these dimensions completely flexible in terms of appearing as series, categories and filter.

## Note

You can select dimension items in different ways:

- Double-click a dimension item name.
- Highlight one or several dimension items and click the single-arrow.
- To select all dimension items in a list, click the double-arrow.
- To clear dimension items, use the arrows or double-click the names in the **Selected** list.

### 8.4.1. Select indicators

The Data Visualizer app can display any number of indicators and data elements in a chart. You can select both indicators and data elements to appear together in the same chart, with their order of appearance the same as the order in which they are selected.

1. Click **Data** and select **Indicators**.

2. Select an indicator group.

The indicators in the selected group appear in the **Available** list.

3. Select one or several indicators by double-clicking the name.

The indicator moves to the **Selected** list.

### 8.4.2. Select data elements

The Data Visualizer app can display any number of indicators and data elements in a chart. You can select both indicators and data elements to appear together in the same chart, with their order of appearance the same as the order in which they are selected.

1. Click **Data** and select **Data elements**.

2. Select a data element group.

The data elements in the selected group appear in the **Available** list.

3. Select one or several data elements by double-clicking the name.

The data element moves to the **Selected** list.

### 8.4.3. Select reporting rates

The Data Visualizer app can display reporting rates in a chart, by itself or together with indicators and data elements. Reporting rates are defined by data sets.

1. Click **Data** and select **Reporting rates**.

The reporting rates appear in the **Available** list.

2. Select one or several reporting rates by double-clicking the name.

The reporting rate moves to the **Selected** list.

### 8.4.4. Select fixed and relative periods

1. Click **Periods**.

## 2. Select one or several periods.

You can combine fixed periods and relative periods in the same chart. Overlapping periods are filtered so that they only appear once.

- Fixed periods: In the **Select period type** box, select a period type. You can select any number of fixed periods from any period type.
- Relative periods: In the lower part of the **Periods** section, select as many relative periods as you like. The names are relative to the current date. This means that if the current month is March and you select **Last month**, the month of February is included in the chart.

## 8.4.5. Select organisation units

1. Click **Organisation units**.
2. Click the gearbox icon.
3. Select a **Selection mode** and an organisation unit.

There are three different selection modes:

**Table 8.2. Selection modes**

Selection mode	Description
<b>Select organisation units</b>	<p>Lets you select the organisation units you want to appear in the chart from the organization tree.</p> <p>Select <b>User org unit</b> to disable the organisation unit tree and only select the organisation unit that is related to your profile.</p> <p>Select <b>User sub-units</b> to disable the organisation unit tree and only select the sub-units of the organisation unit that is related to your profile.</p> <p>Select <b>User sub-x2-units</b> to disable the organisation unit tree and only select organisation units two levels down from the organisation unit that is related to your profile.</p> <p>This functionality is useful for administrators to create a meaningful "system" favorite. With this option checked all users find their respective organisation unit when they open the favorite.</p>
<b>Select levels</b>	<p>Lets you select all organisation units at one or more levels, for example national or district level.</p> <p>You can also select the parent organisation unit in the tree, which makes it easy to select for example, all facilities inside one or more districts.</p>
<b>Select groups</b>	<p>Lets you select all organisation units inside one or several groups and parent organisation units at the same time, for example hospitals or chiefdoms.</p>

4. Click **Update**.

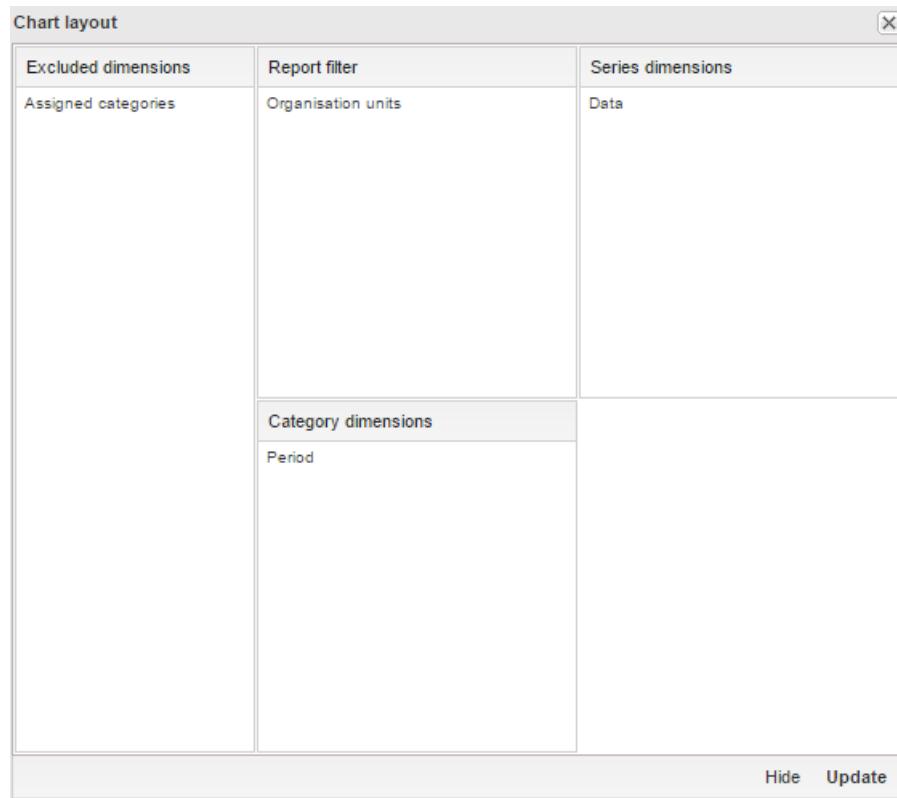

## 8.4.6. Select additional dimension items

Depending on the settings for your organisation unit group sets and data element group sets, you can select additional dimension items from the left menu.

Here you can add dimension items such as age, sex, etc. without having to add them as detailed data element selections. This is useful when you want to separate these categories in your analysis.

The additional dimension items you select are available in **Chart layout** as dimensions.

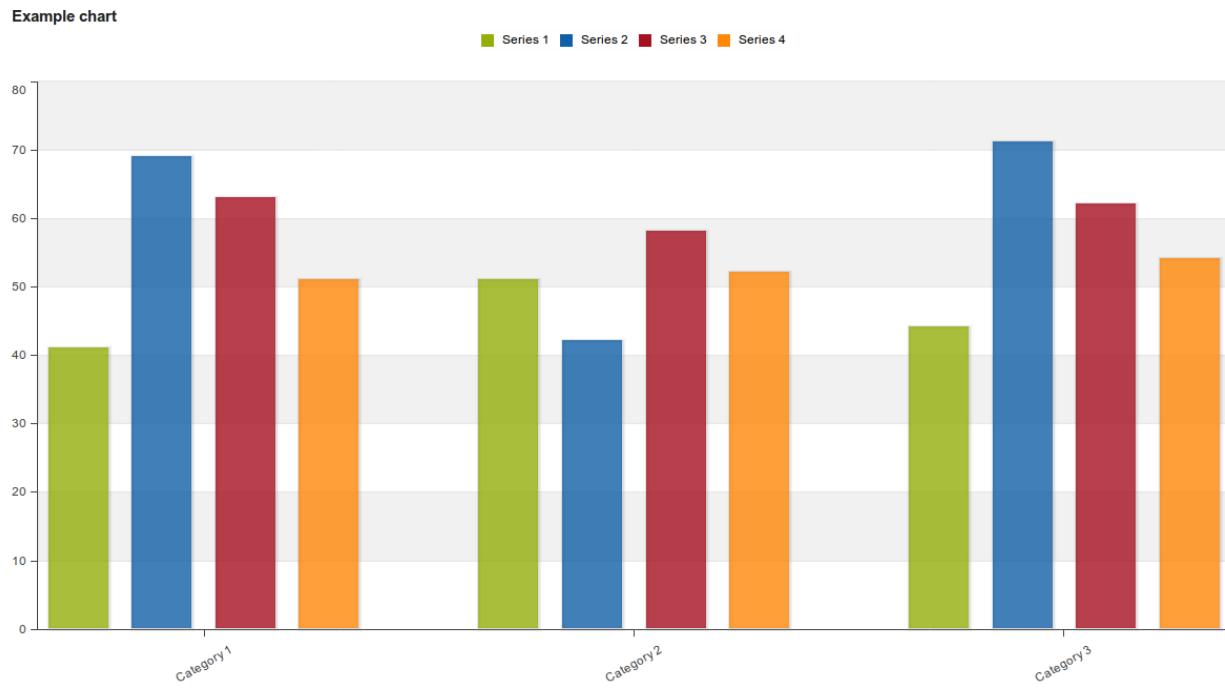

## 8.5. Select series, category and filter

You can define which dimension of the data you want to appear as series, category and filter.

1. Click **Layout**.
2. Drag and drop the dimensions to the appropriate space. Only one dimension can be in each section.
3. Click **Update**.

### Example 8.1. Chart illustrating the concepts of series, categories and filter

- **Series:** A series is a set of continuous, related elements (for example periods or data elements) which you want to visualize in order to emphasize trends or relations in its data.
- **Categories:** A category is a set of elements (for example indicators or organisation units) for which you want to compare its data.
- **Filter:** The filter selection will filter the data displayed in the chart. Note that if you use the data dimension as filter, you can only specify a single indicator or data set as filter item, whereas with other dimension types you can select any number of items.

## 8.6. Change the display of your chart

1. Click **Options**.
2. Set the options as required.

**Table 8.3. Chart options**

<b>Option</b>		<b>Description</b>
<b>Data</b>	<b>Show values</b>	Shows the values above the series in the chart.
	<b>Use 100% stacked values</b>	Displays 100 % stacked values in column charts.
	<b>Use cumulative values</b>	Displays cumulative values in line charts.
	<b>Hide empty categories</b>	Hides the category items with no data from the chart.  <b>None:</b> doesn't hide any of the empty categories  <b>Before first:</b> hides missing values only before the first value

<b>Option</b>	<b>Description</b>
	<p><b>After last:</b> hides missing values only after the last value</p> <p><b>Before first and after last:</b> hides missing values only before the first value and after the last value</p> <p><b>All:</b> hides all missing values</p> <p>This is useful for example when you create column and bar charts.</p>
	<p><b>Trend line</b></p> <p>Displays the trend line which visualizes how your data evolves over time. For example if performance is improving or deteriorating. Useful when periods are selected as category.</p>
	<p><b>Target line value/title</b></p> <p>Displays a horizontal line at the given domain value. Useful for example when you want to compare your performance to the current target.</p>
	<p><b>Base line value/title</b></p> <p>Displays a horizontal line at the given domain value. Useful for example when you want to visualize how your performance has evolved since the beginning of a process.</p>
	<p><b>Sort order</b></p> <p>Allows you to sort the values on your chart from either low to high or high to low.</p>
	<p><b>Aggregation type</b></p> <p>Defines how the data elements or indicators will be aggregated within the chart. Some of the aggregation types are <b>By data element</b>, <b>Count</b>, <b>Min</b> and <b>Max</b>.</p>
<b>Events</b>	<p><b>Include only completed events</b></p> <p>Includes only completed events in the aggregation process. This is useful when you want for example to exclude partial events in indicator calculations.</p>
<b>Axes</b>	<p><b>Range axis min/max</b></p> <p>Defines the maximum and minimum value which will be visible on the range axis.</p>
	<p><b>Range axis tick steps</b></p> <p>Defines the number of ticks which will be visible on the range axis.</p>
	<p><b>Range axis decimals</b></p> <p>Defines the number of decimals which will be used for range axis values.</p>
	<p><b>Range axis title</b></p> <p>Type a title here to display a label next to the range axis (also referred to as the Y axis). Useful when you</p>

Option	Description
	want to give context information to the chart, for example about the unit of measure.
	<b>Domain axis title</b>
	Type a title here to display a label below the domain axis (also referred to as the X axis). Useful when you want to give context information to the chart, for example about the period type.
<b>General</b>	<b>Hide chart legend</b>
	Hides the legend and leaves more room for the chart itself.
	<b>Hide chart title</b>
	Hides the title (default or custom) of your chart.
	<b>Chart title</b>
	Type a title here to display a custom title above the chart. If you don't enter a title, the default title is displayed.
	<b>Hide chart subtitle</b>
	Hides the subtitle of your chart.
	<b>Chart subtitle</b>
	Type a subtitle here to display a custom subtitle above the chart but below the title. If you don't enter a subtitle, no subtitle is displayed in the chart.

3. Click **Update**.

## 8.7. Manage favorites

Saving your charts or pivot tables as favorites makes it easy to find them later. You can also choose to share them with other users as an interpretation or display them on the dashboard.

You view the details and interpretations of your favorites in the **Pivot Table**, **Data Visualizer**, **Event Visualizer**, **Event Reports** apps. Use the **Favorites** menu to manage your favorites.

### 8.7.1. Open a favorite

1. Click **Favorites > Open**.
2. Enter the name of a favorite in the search field, or click **Prev** and **Next** to display favorites.
3. Click the name of the favorite you want to open.

### 8.7.2. Save a favorite

1. Click **Favorites > Save as**.
2. Enter a **Name** and a **Description** for your favorite.
3. Click **Save**.

### 8.7.3. Rename a favorite

1. Click **Favorites > Rename**.
2. Enter the new name for your favorite.

3. Click **Update**.

#### 8.7.4. Write an interpretation for a favorite

An interpretation is a link to a resource with a description of the data at a given period. This information is visible in the **Dashboard** app. To create an interpretation, you first need to create a favorite. If you've shared your favorite with other people, the interpretation you write is visible to those people.

1. Click **Favorites > Write interpretation**.
2. In the text field, type a comment, question or interpretation. You can see this information in the **Dashboard** app.
3. Search for a user group that you want to share your favorite with, then click the + icon.
4. Change sharing settings for the user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **None:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Share**.

#### 8.7.5. Create a link to a favorite

1. Click **Favorites > Get link**.
2. Select one of the following:
  - **Open in this app:** You get a URL for the favorite which you can share with other users by email or chat.
  - **Open in web api:** You get a URL of the API resource. By default this is an HTML resource, but you can change the file extension to ".json" or ".csv".

#### 8.7.6. Delete a favorite

1. Click **Favorites > Delete**.
2. Click **OK**.

#### 8.7.7. View interpretations based on relative periods

To view interpretations for relative periods, such as a year ago:

1. Open a favorite with interpretations.
2. Click **>>>** in the top right of the workspace.
3. Click an interpretation. Your chart displays the data and the date based on when the interpretation was created. To view other interpretations, click them.

### 8.8. Download a chart as an image or a PDF

After you have created a chart you can download it to your local computer as an image or PDF file.

1. Click **Download**.
2. Under **Graphics**, click **Image (.png)** or **PDF (.pdf)**.

The file is automatically downloaded to your computer. Now you can for example embed the image file into a text document as part of a report.

## 8.9. Download chart data source

You can download the data source behind a chart in JSON, XML, Excel, CSV, JXRML or Raw data SQL formats with different identification schemes (ID, Code, and Name). The data document uses identifiers of the dimension items and opens in a new browser window to display the URL of the request to the Web API in the address bar. This is useful for developers of apps and other client modules based on the DHIS2 Web API or for those who require a plain data source, for instance for import into statistical packages.

To download plain data source formats:

1. Click **Download**.
2. Under **Plain data source**, click the format you want to download.

**Table 8.4. Available formats**

Format	Action	Description
JSON	Click <b>JSON</b>	Downloads JSON format based on ID property.  You can also download JSON format based on <b>Code</b> or <b>Name</b> property.
XML	Click <b>XML</b>	Downloads XML format based on ID property.  You can also download XML format based on <b>Code</b> or <b>Name</b> property.
Microsoft Excel	Click <b>Microsoft Excel</b>	Downloads Microsoft Excel format based on ID property.  You can also download Microsoft Excel format based on <b>Code</b> or <b>Name</b> property.
CSV	Click <b>CSV</b>	Downloads CSV format based on ID property.  You can also download CSV format based on <b>Code</b> or <b>Name</b> property.
JRXML	Put the cursor on <b>Advanced</b> and click <b>JRXML</b>	Produces a template of a Jasper Report which can be further customized based on your exact needs and used as the basis for a standard report in DHIS 2.
Raw data SQL	Put the cursor on <b>Advanced</b> and click <b>Raw data SQL</b>	Provides the actual SQL statement used to generate the data visualization. You can use it as a data source in a Jasper report, or as the basis for a SQL view.

## 8.10. Embed charts in any web page

Certain analysis-related resources in DHIS2, like pivot tables, charts and maps, can be embedded in any web page by using a plug-in. You will find more information about the plug-ins in the Web API chapter in the *DHIS2 Developer Manual*.

To generate a HTML fragment that you can use to display the chart in an external web page:

1. Click **Share > Embed in web page**.

The **Embed in web page** window opens.

2. Click **Select** to highlight the HTML fragment.

## 8.11. Open a chart as a pivot table or as a map

- Open a **Chart** and click **Chart** or click **Map**.

# Chapter 9. Using the GIS app

## 9.1. About the GIS app

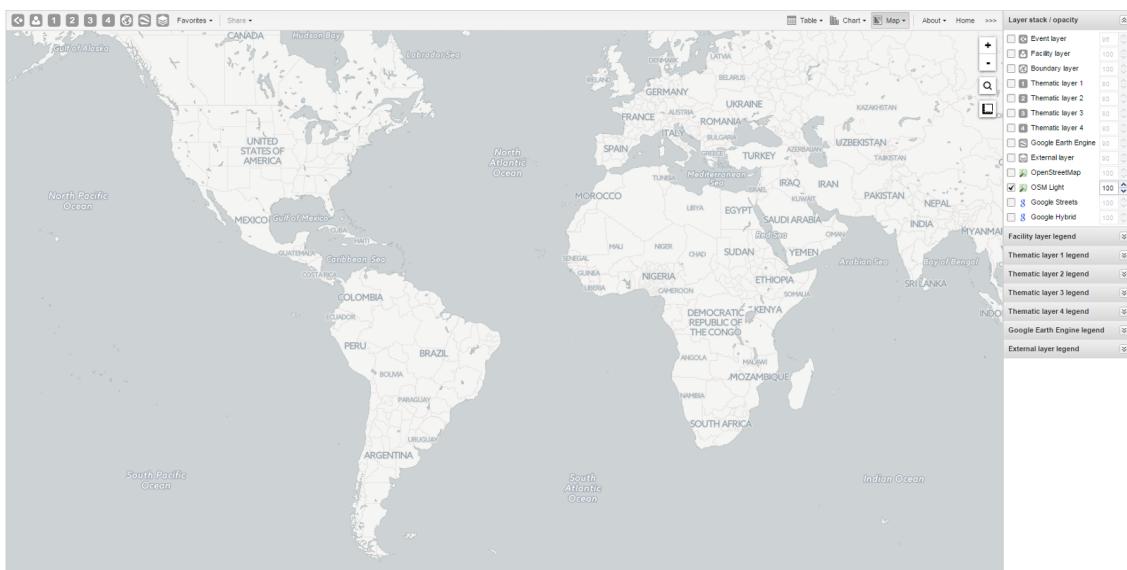

With the GIS app you can overlay multiple layers and choose among different base maps. You can create thematic maps of areas and points, view facilities based on classifications, and visualize catchment areas for each facility. You can add labels to areas and points, and search and filter using various criteria. You can move points and set locations on the fly. Maps can be saved as favorites and shared with other people.

### Note

To use predefined legends in the **GIS** app, you need to create them first in the **Maintenance** app.

Here's an overview of the **GIS** app workspace

- The icons in the top left of the workspace represent the map layers. They are the starting point of the **GIS** app.
- The panel on the right side of the workspace shows an overview of the layers:
  - The default base map is OSM Light. It's selected by default. If you're online you'll also see OpenStreetMap, Google Streets and Google Hybrid. You can use these maps as background maps and layers. Switch between them by selecting or clearing the checkbox.
  - If you want to increase or reduce the opacity of a layer, use the up and down arrows for the selected layer.
  - Use the map legends when you create a thematic map. A legend explains the link between values and colors on your map.
- **Zoom to content** automatically adjusts the zoom level and map center position to put the data on your map in focus.
- To view information for an event, simply click the event.
- Right-click to display the longitude and latitude of the map.

## 9.2. Create a new thematic map

You use four vector layers to create a thematic map. The workflow for creating a new thematic map is:

1. In the **Apps** menu, click **GIS**.

The **DHIS2 GIS** window opens.

2. In the top menu, click a layer you want to add to the map.

- Event layer
- Facility layer
- Boundary layer
- Thematic layer 1 - 4

3. Click **Edit layer** and select the parameters you need..

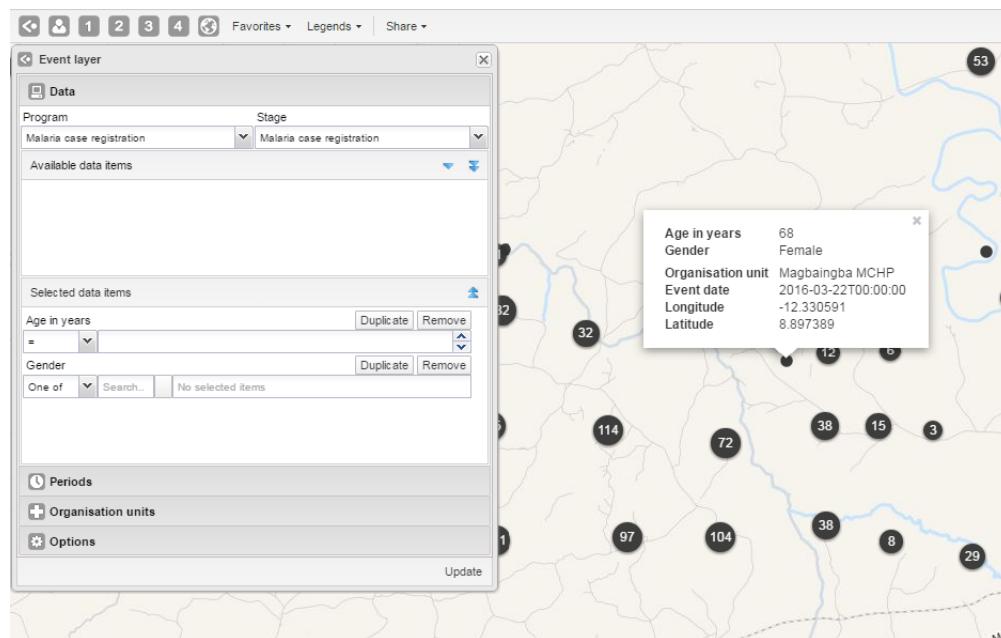

4. Click **Update**.

## 9.3. Manage event layers

The event layer displays the geographical location of events registered in the DHIS2 tracker. Provided that events have associated GPS coordinates, you can use this layer to drill down from the aggregated data displayed in the thematic layers to the underlying individual events or cases.

You can also display aggregated events at the facility or at the boundary level. You do this through a thematic layer using event data items. This is useful when you only have the coordinates for the Org Unit under which the events are recorded.

### Event layer

### 9.3.1. Create or modify event layer

1. In the top menu, click the event layer icon.

2. Click **Edit layer**.

3. Select a program and then select a program stage.

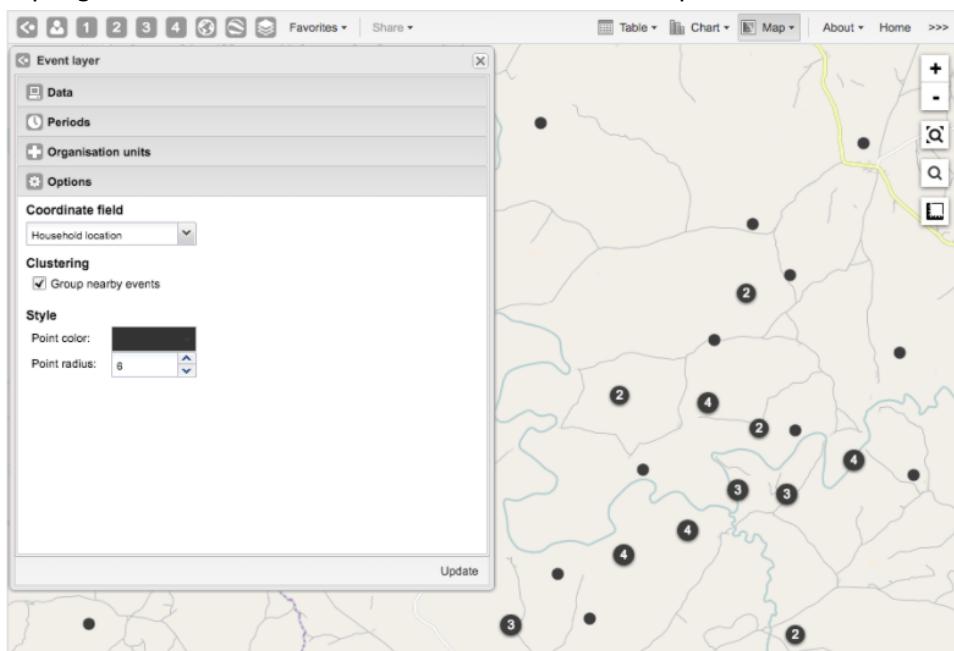

If there is only one stage available for the selected program, the stage is automatically selected. A list of data elements and attributes will appear in the **Available data items** panel.

4. Select any data element or attribute from this list as part of your query.

- To select you can either double-click a data element or (multi) select and use the single-arrow downward button. The double-arrow button will select all data elements in the list. All selected data elements will get their own row in the **Selected data items**.
  - For data elements of type text you will get two choices: **Contains** implies that the query will match all values which contains your search value, and **Is exact** implies that only values which is completely identical to your search query will be returned.
  - For data elements of type option set, you can select any of the options from the drop down box by using the down-wards arrow or by start typing directly in the box to filter for options.
5. In the **Periods** section, select the time span for when the events took place. You can select either a fixed period or a relative period.
- Fixed period: In the **Period** field, select **Start/end dates** and fill in a start date and an end date.
  - Relative period: In the **Period** field, select one of the relative periods, for example **This month** or **Last year**.
6. In the **Organisation units** section, select the organisation units you want to include in the query.

#### 7. In the **Options** section, you can:

- Select a value from the **Coordinate field** for the positions shown on the map. By default, "Event location" is selected. Depending on the data elements or attributes that belong to a program, other coordinates such as "Household position" are available.

- Select or clear **Clustering** to group nearby events.
- Go to **Style** to select a color for the cluster points or change the radius of clusters (between 1 and 20).

**Clustering** if you want to group nearby events and change the style of the cluster points.

#### 8. Click **Update**.

### 9.3.2. Turn off cluster

By default events are clustered in a map. You can turn off this function to display all events separately.

- In the top menu, click the event layer icon.
- Click **Edit layer**.
- Click **Options**.

4. Clear **Group nearby events** check box.
5. Click **Update**.

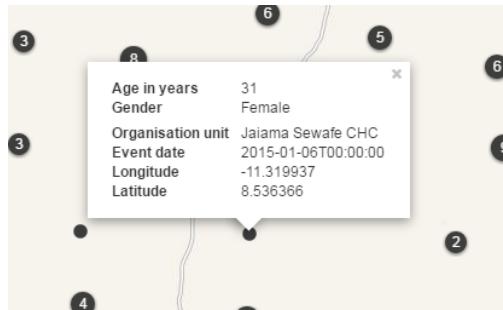

### 9.3.3. Modify cluster style

1. In the top menu, click the event layer icon.
2. Click **Edit layer**.
3. In the **Options** section, change the **Point color** and **Point radius**.
4. Click **Update**.

### 9.3.4. Modify information in event pop-up windows

For events in a cluster map, you can modify the information displayed in the event pop-up window.

#### Pop-up window with event information

1. Open the **Programs / Attributes** app.
2. Click **Program**.
3. Click the program you want to modify and select **View program stages**.
4. Click the program stage name and select **Edit**.
5. Scroll down to the **Selected data elements** section.
6. For every data element you want to display in the pop-up window, select corresponding **Display in reports**.
7. Click **Update**.

### 9.3.5. Clear event layer

To clear all data in a map:

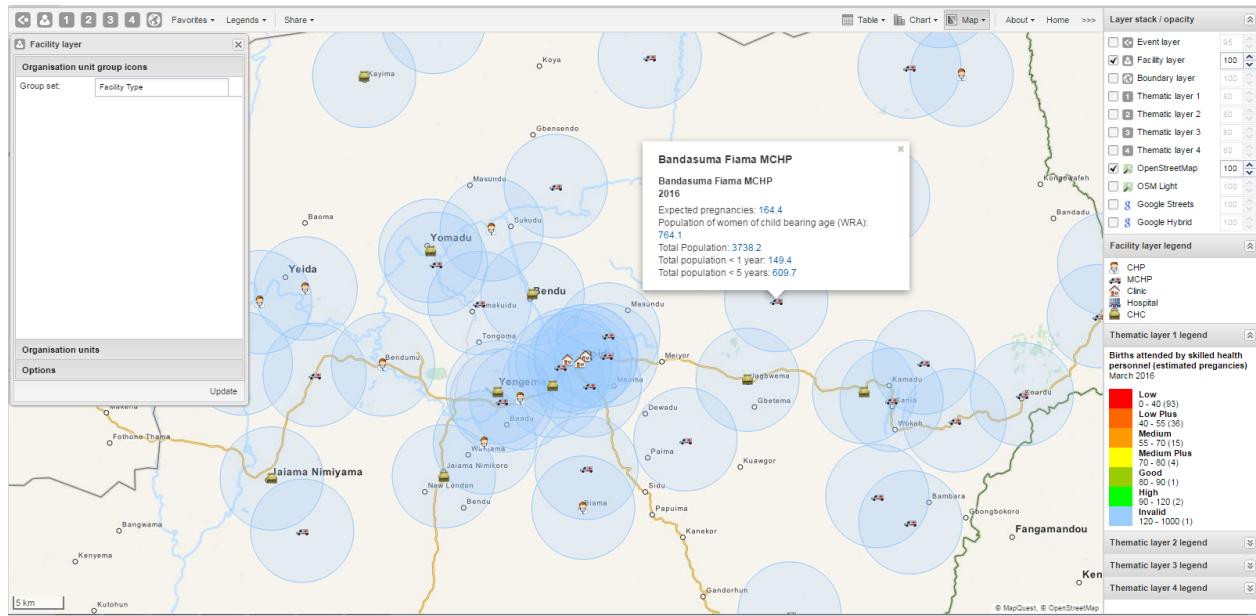

1. In the top menu, click the event layer icon.
2. Click **Clear**.

## 9.4. Manage facility layers

The facility layer displays icons that represent types of facilities. Polygons do not show up on the map, so make sure that you select an organisation unit level that has facilities.

A polygon is an enclosed area on a map representing a country, a district or a park. In GIS, a polygon is a shape defined by one or more rings, where a ring is a path that starts and ends at the same point.

## Facility layer

### 9.4.1. Create or modify a facility layer

1. In the top menu, click the facility layer icon.
2. Click **Edit layer**.
3. In the **Organisation unit group icons** section, select a **Group set**.
4. In the **Organisation units** section, select one or several organisation units.
5. In the **Options** section, select if you want to show labels and if so, how they look.
6. In the **Options** section, select if you want to display a circle with a certain radius around each facility.
7. Click **Update**.

### 9.4.2. Search for an organisation unit

To locate an organisation unit in the map:

1. In the top menu, click the facility layer icon.
2. Click **Search**.

The **Organisation unit search** dialog box opens.

3. In the text field, type the name of the organisation unit you are looking for or click a name in the list.

The organisation unit is highlighted in the map.

### 9.4.3. Clear facility layer

To clear all data in a facility layer:

1. In the top menu, click the facility layer icon.
2. Click **Clear**.

## 9.5. Manage facilities in a layer

You can have facilities in **Facility**, **Boundary** and **Thematic** layers.

### 9.5.1. Relocate a facility

1. Right-click a facility and click **Relocate**.
2. Put the cursor in the new location.

The new coordinate is stored permanently. This cannot be undone.

### 9.5.2. Swap longitude and latitude of a facility

1. Right-click a facility and click **Swap long/lat**.

This is useful if a user inverted latitude and longitude coordinates when creating the organisation unit.

### 9.5.3. Display facility information

You can view organisation unit information set by the administrator as follows:

**Table 9.1. View organisation unit information**

Function	Action
View information for the current period	1. Click a facility.
View information for a selected period	<p>1. Right-click a facility and click <b>Show information</b>.</p> <p>2. In the <b>Infrastructural data</b> section, select a period.</p> <p> <b>Note</b></p> <p>You configure the displayed infrastructural data in the <b>System Settings</b> app.</p>

## 9.6. Manage thematic layers 1- 4

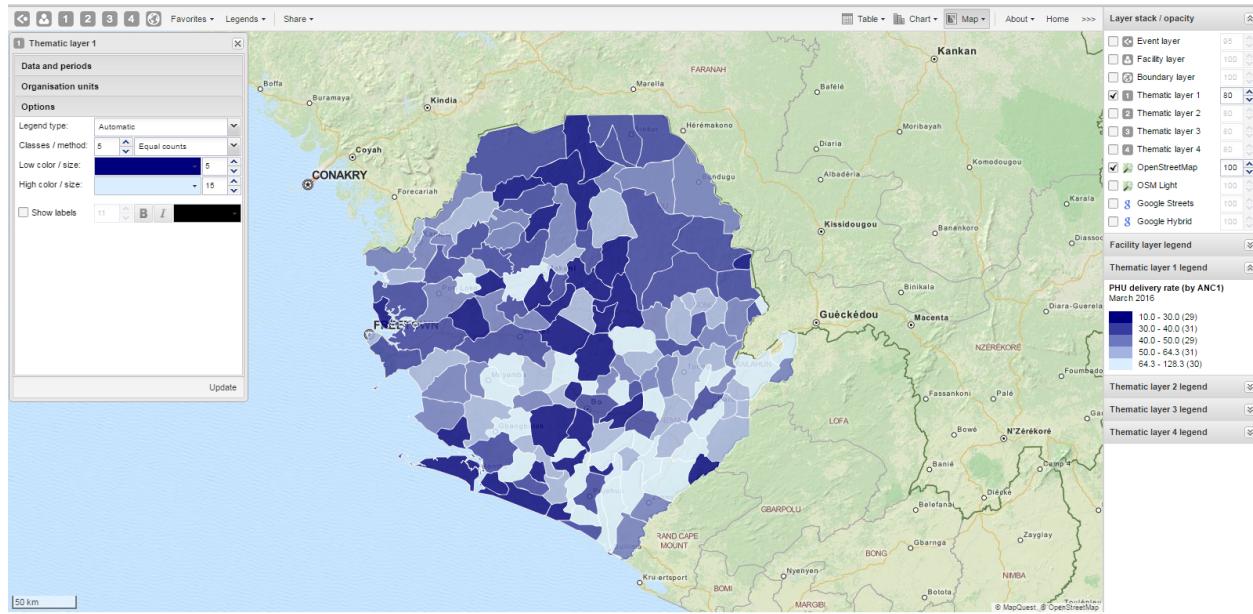

There are four thematic layers in the GIS app. With these layers panels you can use your data for thematic mapping. Select your desired combination of indicator/data element, and period. then the organisation unit level. If your database has coordinates and aggregated data values for these organisation units, they will appear on the map.

#### Note

You must refresh the DHIS2 analytics tables to have aggregated data values available.

## Example of a thematic map

### 9.6.1. Create or modify a thematic layer

1. In the top menu, click the icon of the thematic layer you want to create or modify.
2. Click **Edit layer**.
3. In the **Data and periods** section, select the data and periods you want to display.
4. In the **Organisation units** section, select one or several organisation units.
5. In the **Options** section, go to **Legend type** and select Automatic or Predefined.
  - Automatic legend types means that the application will create a legend set for you based on your what method, number of classes, low color and high color you select. Method alludes to the size of the legend classes.

Set to Equal intervals they will be “highest map value – lowest map value / number of classes”.

Set to Equal counts the legend creator will try to distribute the organisation units evenly.

The legend appears as an even gradation from the start color to the end color.

- If you have facilities in your thematic layer, you can set the radius for maximum and minimum values by changing the values in the **Low color / size** and **High color size** boxes.

6. In the **Options** section, select if you want to show labels and if so, how they look.
7. In the Options panel, select an aggregation type. See also [Aggregation operators](#).
8. Click **Update**.

### 9.6.2. Filter values in a thematic layer

Thematic layer 1-4 menu have a **Filter** option in addition to the boundary layer menu options. It lets you apply value filters to the organisation units on the map. The filter is removed when you close the filter window.

To filter values in a thematic layer:

1. In the top menu, click the icon of thematic layer you want to create or modify.
2. Click **Filter....**
3. Modify the **Greater than** and **And/or lower than** values.

4. Click **Update**.

### 9.6.3. Search for an organisation unit

To locate an organisation unit in a thematic layer:

1. In the top menu, click the relevant thematic layer icon.
2. Click **Search**.

The **Organisation unit search** dialog box opens.

3. In the text field, type the name of the organisation unit you are looking for or click a name in the list.

The organisation unit is highlighted in the map.

### 9.6.4. Navigate between organisation hierarchies

When there are visible organisation units on the map, you can easily navigate up and down in the hierarchy without using the level/parent user interface.

1. Right-click one of the organisation units.
2. Select **Drill up** or **Drill down**.

The drill down option is disabled if you are on the lowest level or if there are no coordinates available on the level below. Vice versa goes for drilling up.

### 9.6.5. Clear thematic layer

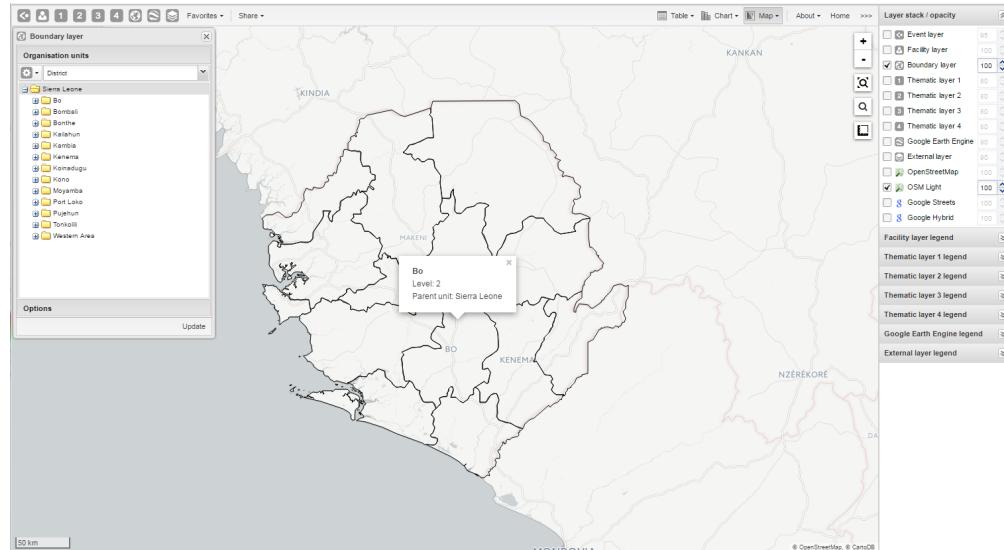

To clear all data in a thematic layer:

1. In the top menu, click the relevant thematic layer icon.
2. Click **Clear**.

## 9.7. Manage boundary layers

The boundary layer displays the borders and locations of your organisation units. This layer is useful if you are offline and don't have access to background maps.

### Boundary layer

### 9.7.1. Create or modify boundary layers

1. In the top left menu, click the boundary layer icon.
2. Click **Edit layer**.
3. In the **Organisation units** section, select one or several organisation units.

You can select the organisation units you want to show on the map by selecting a level and a parent. That means "show all organisations units at this level that are children of this parent".

4. In the **Options** section, select if you want to show labels and if so, how they look.
5. Click **Update**.

### 9.7.2. Search for organisation units

To locate an organisation unit on the map:

1. In the top menu, click the boundary layer icon.
2. Click **Search**.

The **Organisation unit search** dialog box opens.

3. In the text field, type the name of the organisation unit you are looking for or click a name in the list.

The organisation unit is highlighted in the map.

### 9.7.3. Navigate between organisation hierarchies

When there are visible organisation units on the map, you can easily navigate up and down in the hierarchy without using the level/parent user interface.

1. Right-click one of the organisation units.
2. Select **Drill up** or **Drill down**.

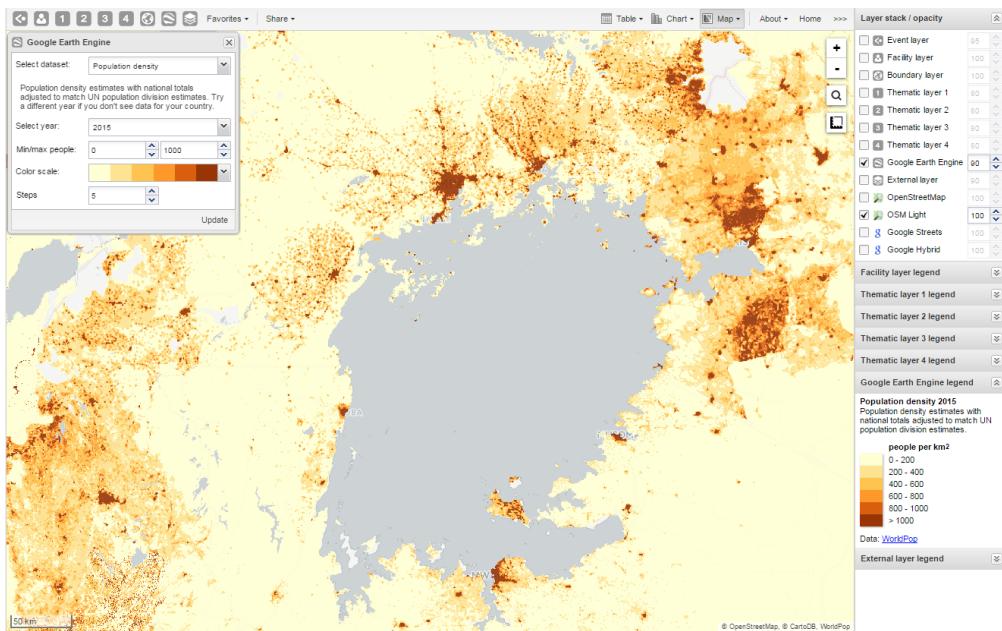

The drill down option is disabled if you are on the lowest level or if there are no coordinates available on the level below. The same applies when you are drilling up.

### 9.7.4. Clear boundary layer

To clear data in a boundary layer:

1. In the top menu, click the boundary layer icon.
2. Click **Clear**.

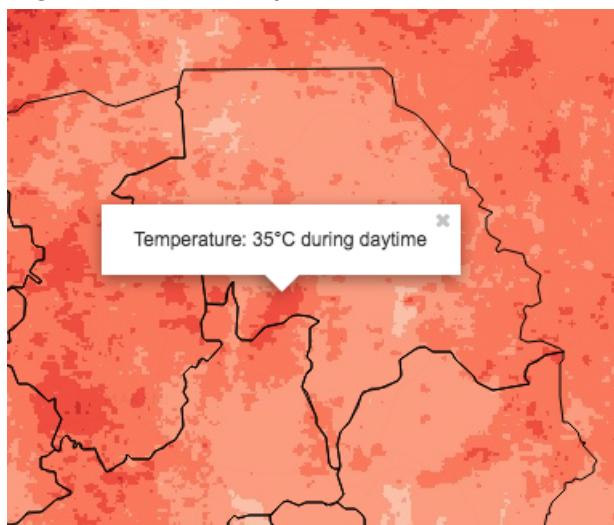

## 9.8. Manage Earth Engine layer

The Google Earth Engine layer lets you display satellite imagery and geospatial datasets from Google's vast catalog. This layer is useful in combination with thematic and event layers to enhance analysis. The following layers are supported:

- Elevation: Metres above sea level
- Nighttime lights: Lights from cities, towns, and other sites with persistent lighting, including gas flares (from 2013)
- Population density: Population in 100 x 100 m grid cells (from 2010)
- Temperature, population and land cover at any location.

Right-click on the layers to view more information, for example temperature and elevation.

### 9.8.1. Create or modify an Earth Engine layer

1. In the top menu, click the **Google Earth Engine** layer icon.
2. Select a data set, for example "Elevation".
3. Select **Min / max value**.

The meaning of these values depend on which data set you've selected.

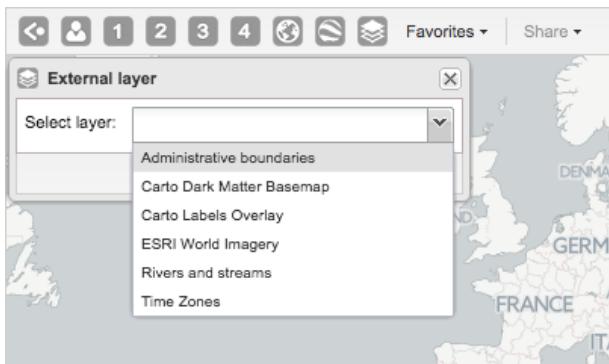

4. Select a **Color scale**.
5. Select the number of **Steps**.

The number of steps means the number of distinct colors in the color scale.

6. Click **Update**.

## 9.9. Add external map layers

1. In the top menu, click the **External layer** icon.
2. Click **Edit** to add a new layer.
3. Select a layer from the list.

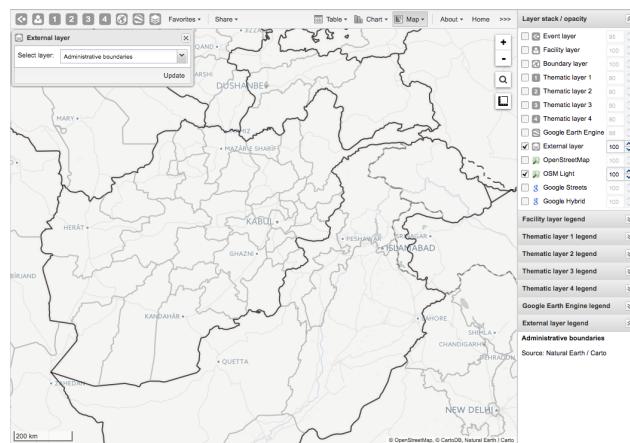

4. Click **Update**.

To remove a layer, click **Clear**.

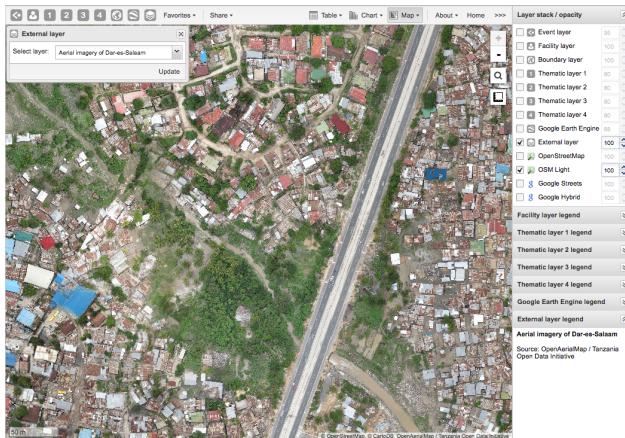

To hide a layer, go to the **Layer stack-opacity** menu pane and clear the **External layer** checkbox.

Here are some examples of external layers:

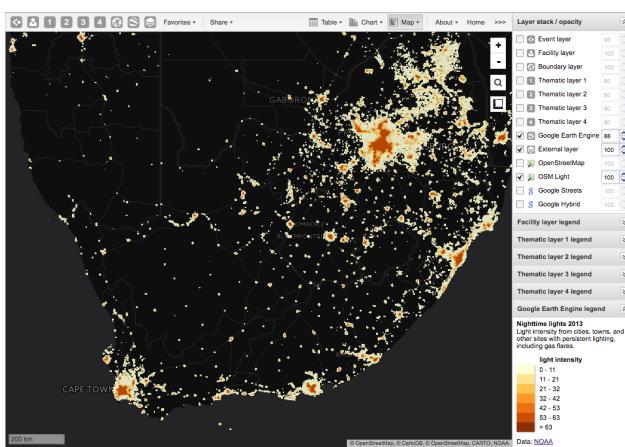

### Example 1: First-order administrative boundaries

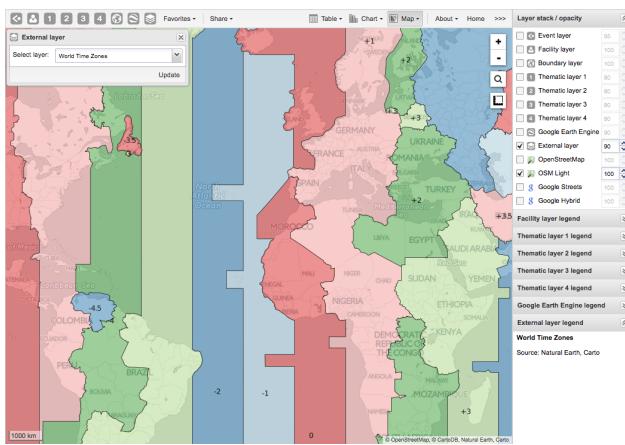

## Example 2: Aerial imagery of Dar-es-Salaam

## Example 3: Dark basemap with nighttime lights from Google Earth Engine

## Example 4: World time zones

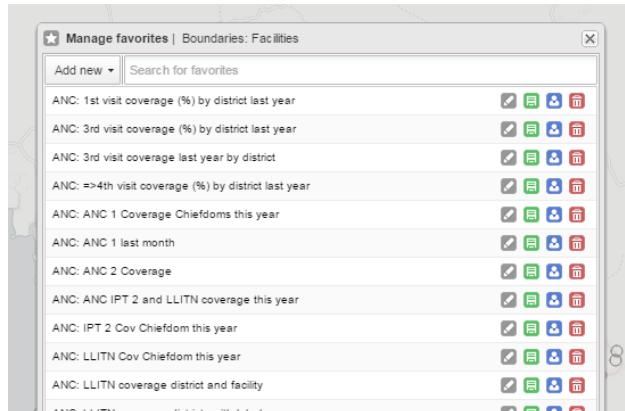

## Note

To define external map layers, see the [Maintenance app documentation](#).

## 9.10. Manage map favorites

### Favorite maps

Saving your maps as favorites makes it easy to restore them later. It also gives you the opportunity to share them with other users as an interpretation or put it on the dashboard. You can save all types of layers as a favorite. A favorite always opens with the default background map.

#### 9.10.1. Save a map as a favorite

When you have created a map it is convenient to save it as a favorite:

1. Click **Favorites**.

The **Manage favorites** dialog box opens.

2. Click **Add new**.

The **Create new favorite** dialog box opens.

3. In the text field, type the name you want to give your pivot table.
4. Click **Create**.

Your favorite is added to the list.

#### 9.10.2. Open a favorite

1. Click **Favorites**.

The **Manage favorites** dialog box opens.

2. Find the favorite you want to open. You can either use **Prev** and **Next** or the search field to find a saved favorite. The list is filtered on every character that you enter.
3. Click the name.

#### 9.10.3. Rename a favorite

1. Click **Favorites**.

The **Manage favorites** dialog box opens.

2. Find the favorite you want to rename.

You can either use **Prev** and **Next** or the search field to find a saved favorite.

3. Click the grey rename icon next to the favorite's name.

The **Rename favorite** dialog box favorite opens.

4. Type the new name and click **Update**.

#### 9.10.4. Overwrite a favorite

To save the current map to an existing favorite (overwrite):

1. Click **Favorites**.

The **Manage favorites** dialog box opens.

2. Find the favorite you want to overwrite.

You can either use **Prev** and **Next** or the search field to find a saved favorite.

3. Click the green overwrite icon next to the favorite's name.

4. Click **OK** to confirm that you want to overwrite the favorite.

#### 9.10.5. Share a map interpretation

For certain analysis-related resources in DHIS2, you can share a data interpretation. An interpretation is a link to the relevant resource together with a text expressing some insight about the data.

To create an interpretation of a map and share it with all users of the system:

1. Open or create a favorite map.
2. Click **Share > Write interpretation**.

The **Write interpretation** dialog box opens.

3. In the text field, type a comment, question or interpretation.
4. Click **Share**.

The dialog box closes automatically. You can see the interpretation on the **Dashboard**.

#### 9.10.6. Modify sharing settings for a favorite

After you have created a map and saved it as a favorite, you can share the favorite with everyone or a user group. To modify the sharing settings:

1. Click **Favorites**.
2. Find the favorite you want to share.

You can either use **Prev** and **Next** or the search field to find a saved favorite.

3. Click the blue share icon next to the favorite's name.
4. In the text box, enter the name of the user group you want to share your favorite with and click the **+** icon.

The chosen user group is added to the list of recipients.

Repeat the step to add more user groups.

5. If you want to allow external access, select the corresponding box.
6. For each user group, choose an access setting. The options are:
  - None
  - Can view
  - Can edit and view
7. Click **Save**.

## 9.10.7. Delete a favorite

1. Click **Favorites**.

The **Manage favorites** dialog box opens.

2. Find the favorite you want to delete.

You can either use **Prev** and **Next** or the search field to find a saved favorite.

3. Click the red delete icon next to the favorite's name.

4. Click **OK** to confirm that you want to delete the favorite.

## 9.11. Save a map as an image

1. Take a screenshot of the map with the tool of your choice.

2. Save the screenshot in desired format.

## 9.12. Embed a map in an external web page

Certain analysis-related resources in DHIS2, like pivot tables, charts and maps, can be embedded in any web page by using a plug-in. You will find more information about the plug-ins in the Web API chapter in the *DHIS2 Developer Manual*.

To generate a HTML fragment that you can use to display the map in an external web page:

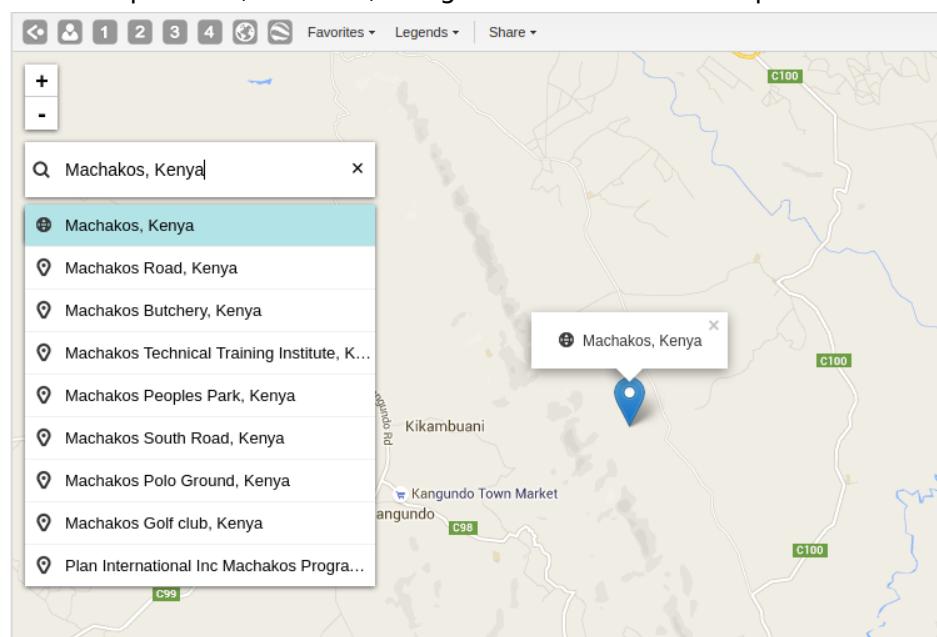

1. Click **Share > Embed in web page**.

The **Embed in web page** window opens.

2. Click **Select** to highlight the HTML fragment.

## 9.13. Search for a location

The place search function allows you to search for almost any location or address. The place search is powered by the Mapzen mapping platform. This function is useful in order to locate for example sites, facilities, villages or towns on the map.

1. On the left side of the GIS window, click the magnifier icon.

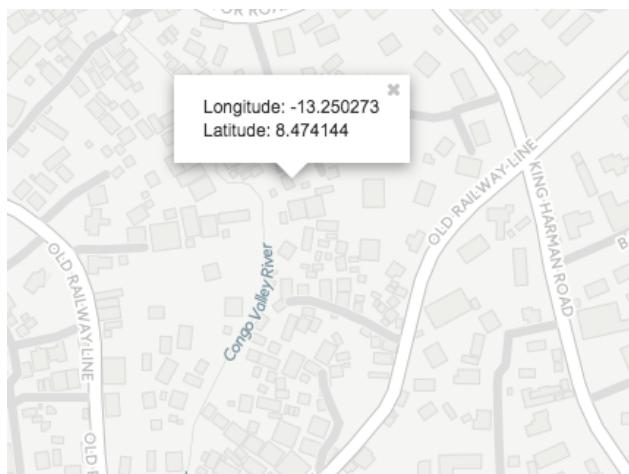

2. Type the location you're looking.  
A list of matching locations appear as you type.
3. From the list, select a location. A pin indicates the location on the map.

## 9.14. Measure distances and areas in a map

1. In the upper left part of the map, put the cursor on the **Measure distances and areas** icon and click **Create new measurement**.
2. Add points to the map.
3. Click **Finish measurement**.

## 9.15. Get the latitude and longitude at any location

Right-click a map and select **Show longitude/latitude**. The values display in a pop-up window.

## 9.16. View a map as a pivot table or chart

When you have made a map you can switch between pivot table, chart and map visualization of your data. The function is inactive if the data the map is based on cannot render as a chart or table.

### 9.16.1. Open a map as a chart

1. Click **Chart > Open this map as chart**.

Your current map opens as a chart.

### 9.16.2. Open a map as a pivot table

1. Click **Chart > Open this map as table**.

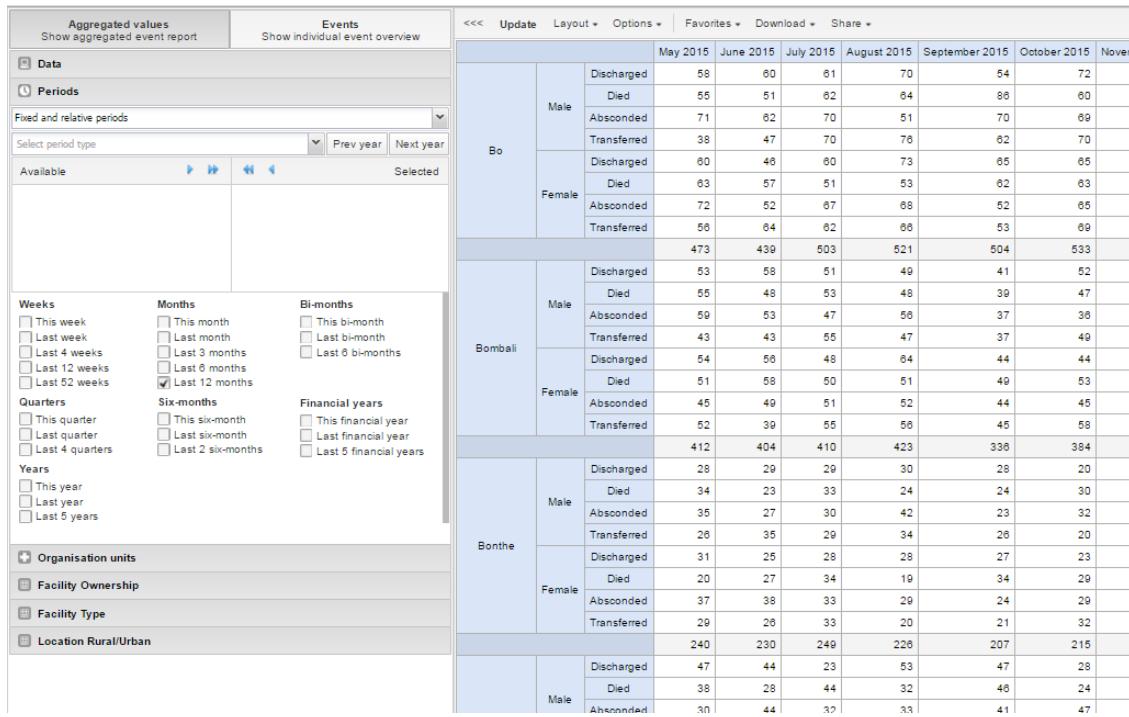

Your current map opens as a pivot table.

## 9.17. See also

# Chapter 10. Using the Event Reports app

## 10.1. About the Event Reports app

The screenshot shows the Event Reports app interface. On the left, there is a sidebar with several filter categories: Data, Periods, Weeks, Months, Bi-months, Quarters, Six-months, Financial years, Years, Organisation units, Facility Ownership, Facility Type, and Location Rural/Urban. The 'Events' tab is selected at the top right. The main area displays a pivot table with dimensions for Program (Bo, Bombali, Bonthe), Gender (Male, Female), and Event Type (Discharged, Died, Absconded, Transferred). The table includes a header row for months from May 2015 to November. The data shows counts for each combination of dimension values.

		Events						
		Show individual event overview						
Aggregated values		Show aggregated event report						
<<<	Update	Layout	Options	Favorites	Download	Share		
Bo	Male	May 2015	June 2015	July 2015	August 2015	September 2015	October 2015	Novem
		Discharged	58	60	61	70	64	72
		Died	55	51	62	64	66	60
		Absconded	71	62	70	51	70	69
	Female	Transferred	38	47	70	76	62	70
		Discharged	60	46	60	73	65	65
		Died	63	57	51	53	62	63
		Absconded	72	52	67	68	52	65
Bombali	Male	Transferred	56	64	62	66	53	69
			473	439	503	521	504	533
		Discharged	53	58	51	49	41	52
		Died	55	48	53	48	39	47
	Female	Absconded	59	53	47	56	37	38
		Transferred	43	43	56	47	37	49
		Discharged	54	56	48	64	44	44
		Died	51	58	50	51	49	53
Bonthe	Male	Absconded	45	49	51	52	44	45
		Transferred	52	39	55	56	45	58
			412	404	410	423	336	384
		Discharged	28	29	29	30	28	20
	Female	Died	34	23	33	24	24	30
		Absconded	35	27	30	42	23	32
		Transferred	26	35	29	34	26	20
		Discharged	31	25	28	28	27	23
	Male	Died	20	27	34	19	34	29
		Absconded	37	38	33	29	24	29
		Transferred	29	26	33	20	21	32
	Male		240	230	249	228	207	215
		Discharged	47	44	23	53	47	28
		Died	38	28	44	32	46	24
		Absconded	30	44	39	33	41	47

With the **Event Reports** app you can analyse events in two types of reports:

- Aggregated event reports: Pivot table-style analysis with aggregated numbers of events

By selecting **Aggregated values** from the top-left menu you can use the **Event Reports** app to create pivot tables with aggregated numbers of events. An event report is always based on a program. You can do analysis based on a range of dimensions. Each dimension can have a corresponding filter. Dimensions can be selected from the left-side menu.

- Individual event reports: Lists of events

By selecting **Events** from the top-left menu you can use the **Event Reports** app to make searches or queries for events based on a flexible set of criteria. The report will be displayed as a table with one row per event. Each dimension can be used as a column in the table or as a filter. Each dimension can have a criteria (filter). Data elements of type option set allows for "in" criteria, where multiple options can be selected. Numeric values can be compared to filter values using greater than, equal or less than operators.

## 10.2. Create an event report

1. Open the **Event Reports** app.
2. Select **Aggregated values** or **Events**.
3. In the menu to the left, select the meta data you want to analyse.
4. Click **Layout** and arrange the dimensions.

You can keep the default selection if you want.

5. Click **Update**.

## 10.3. Select dimension items

An event report is always based on a program and you can do analysis based on a range of dimensions. For programs with category combinations, you can use program categories and category option group sets as dimensions for tables and charts. Each dimension item can have a corresponding filter.

1. Select data elements:

- Click **Data**.
- Select a program and a program stage.

The data elements associated with the selected program are listed under **Available**. Each data element acts as a dimension.

- Select the data elements you need by double-clicking their names.

After selecting a data element, it is visible under **Selected data items**.

- (Optional) For each data element, specify a filter with operators such as "greater than", "in" or "equal" together with a filter value.

2. Select periods.

- Click **Periods**.
- Select one or several periods.

You have three period options: relative periods, fixed periods and start/end dates. You can combine fixed periods and relative periods in the same chart. You cannot combine fixed periods and relative periods with start/end dates in the same chart. Overlapping periods are filtered so that they only appear once.

- Fixed periods: In the **Select period type** box, select a period type. You can select any number of fixed periods from any period type. Fixed periods can for example be "January 2014".
- Relative periods: In the lower part of the **Periods** section, select as many relative periods as you like. The names are relative to the current date. This means that if the current month is March and you select **Last month**, the month of February is included in the chart. Relative periods has the advantage that it keeps the data in the report up to date as time goes.
- Start/end dates: In the list under the **Periods** tab, select **Start/end dates**. This period type lets you specify flexible dates for the time span in the report.

3. Select organisation units.

- Click **Organisation units**.
- Click the gearbox icon.
- Select a **Selection mode** and an organisation unit.

There are three different selection modes:

**Table 10.1. Selection modes**

Selection mode	Description
<b>Select organisation units</b>	Lets you select the organisation units you want to appear in the chart from the organization tree.  Select <b>User org unit</b> to disable the organisation unit tree and only select the organisation unit that is related to your profile.  Select <b>User sub-units</b> to disable the organisation unit tree and only select the sub-units of the organisation unit that is related to your profile.

Selection mode	Description
	Select <b>User sub-x2-units</b> to disable the organisation unit tree and only select organisation units two levels down from the organisation unit that is related to your profile.  This functionality is useful for administrators to create a meaningful "system" favorite. With this option checked all users find their respective organisation unit when they open the favorite.
<b>Select levels</b>	Lets you select all organisation units at one or more levels, for example national or district level.  You can also select the parent organisation unit in the tree, which makes it easy to select for example, all facilities inside one or more districts.
<b>Select groups</b>	Lets you select all organisation units inside one or several groups and parent organisation units at the same time, for example hospitals or chiefdoms.

4. Click **Update**.

## 10.4. Select series, category and filter

You can define which data dimension you want to appear as columns, rows and filters in the pivot table. Each data element appears as individual dimensions and can be placed on any of the axes.

### Note

Data elements of continuous value types (real numbers/decimal numbers) can only be used as filters, and will automatically be positioned as filters in the layout dialog. The reason for this is that continuous number cannot be grouped into sensible ranges and used on columns and rows.

1. Click **Layout**.
2. Drag and drop the dimensions to the appropriate space.
3. Click **Update**.

## 10.5. Change the display of your table

You can customize the display of an event report.

1. Click **Options**.
2. Set the options as required. Available options are different between aggregated event reports and individual event reports.

**Table 10.2. Event reports options**

Option	Description	Available for report type
<b>Data</b>	<b>Show column totals</b>	Displays totals at the end of each column in the pivot table.  Aggregated event report

<b>Option</b>	<b>Description</b>	<b>Available for report type</b>
	<b>Show column sub-totals</b>	Displays sub-totals for each column in the pivot table.
	<b>Show row totals</b>	Displays totals at the end of each row in the pivot table.
	<b>Show row sub-totals</b>	Displays sub-totals for each row in the pivot table.
	<b>Show dimension labels</b>	Displays labels for dimensions.
	<b>Hide empty rows</b>	Hides empty rows in the pivot table.
	<b>Hide n/a data</b>	Hides data tagged as N/A from the chart.
	<b>Include only completed events</b>	<p>Includes only completed events in the aggregation process. This is useful when you want for example to exclude partial events in indicator calculations.</p> <p>Aggregated event report</p> <p>Individual event report</p>
	<b>Limit</b>	Sets a limit of the maximum number of rows that you can display in the table, combined with a setting for showing top or bottom values.
	<b>Output type</b>	Defines the output type. The output types are <b>Event</b> , <b>Enrollment</b> and <b>Tracked entity instance</b> .
	<b>Program status</b>	Filters data based on the program status: <b>All</b> , <b>Active</b> , <b>Completed</b> or <b>Cancelled</b> .
	<b>Event status</b>	Filters data based on the event status: <b>All</b> , <b>Active</b> , <b>Completed</b> , <b>Scheduled</b> , <b>Overdue</b> or <b>Skipped</b> .
<b>Organisation units</b>	<b>Show hierarchy</b>	Includes the names of all parents of each organisation unit in labels.
<b>Style</b>	<b>Display density</b>	<p>Controls the size of the cells in the table. You can set it to <b>Comfortable</b>, <b>Normal</b> or <b>Compact</b>.</p> <p><b>Compact</b> is useful when you want to fit large tables into the browser screen.</p> <p>Aggregated event report</p> <p>Individual event report</p>

Option	Description	Available for report type
<b>Font size</b>	Controls the size of the table text font. You can set it to <b>Large</b> , <b>Normal</b> or <b>Small</b> .	Aggregated event report Individual event report
<b>Digit group separator</b>	Controls which character to separate groups of digits or "thousands". You can set it to <b>Comma</b> , <b>Space</b> or <b>None</b> .	Aggregated event report Individual event report

3. Click **Update**.

## 10.6. Download chart data source

You can download the data source behind an event report in HTML, JSON, XML, Microsoft Excel or CSV formats.

1. Click **Download**.
2. Under **Plain data source**, click the format you want to download.

**Table 10.3. Available formats**

Format	Description
HTML	Creates HTML table based on selected meta data
JSON	Downloads data values in JSON format based on selected meta data
XML	Downloads data values in XML format based on selected meta data
Microsoft Excel	Downloads data values in Microsoft Excel format based on selected meta data
CSV	Downloads data values in CSV format based on selected meta data

## 10.7. Manage favorites

Saving your charts or pivot tables as favorites makes it easy to find them later. You can also choose to share them with other users as an interpretation or display them on the dashboard.

You view the details and interpretations of your favorites in the **Pivot Table**, **Data Visualizer**, **Event Visualizer**, **Event Reports** apps. Use the **Favorites** menu to manage your favorites.

### 10.7.1. Open a favorite

1. Click **Favorites > Open**.
2. Enter the name of a favorite in the search field, or click **Prev** and **Next** to display favorites.
3. Click the name of the favorite you want to open.

### 10.7.2. Save a favorite

1. Click **Favorites > Save as**.

2. Enter a **Name** and a **Description** for your favorite.
3. Click **Save**.

### 10.7.3. Rename a favorite

1. Click **Favorites > Rename**.
2. Enter the new name for your favorite.
3. Click **Update**.

### 10.7.4. Write an interpretation for a favorite

An interpretation is a link to a resource with a description of the data at a given period. This information is visible in the **Dashboard** app. To create an interpretation, you first need to create a favorite. If you've shared your favorite with other people, the interpretation you write is visible to those people.

1. Click **Favorites > Write interpretation**.
2. In the text field, type a comment, question or interpretation. You can see this information in the **Dashboard** app.
3. Search for a user group that you want to share your favorite with, then click the **+** icon.
4. Change sharing settings for the user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **None:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Share**.

### 10.7.5. Create a link to a favorite

1. Click **Favorites > Get link**.
2. Select one of the following:
  - **Open in this app:** You get a URL for the favorite which you can share with other users by email or chat.
  - **Open in web api:** You get a URL of the API resource. By default this is an HTML resource, but you can change the file extension to ".json" or ".csv".

### 10.7.6. Delete a favorite

1. Click **Favorites > Delete**.
2. Click **OK**.

### 10.7.7. View interpretations based on relative periods

To view interpretations for relative periods, such as a year ago:

1. Open a favorite with interpretations.
2. Click **>>>** in the top right of the workspace.
3. Click an interpretation. Your chart displays the data and the date based on when the interpretation was created. To view other interpretations, click them.

## 10.8. Visualize an event report as a chart

When you have made an event report you can open it as a chart:

Click **Chart > Open this chart as table.**

# Chapter 11. Using the Event Visualizer app

## 11.1. About the Event Visualizer app

With the **Event Visualizer** app, you can create charts based on event data.

## 11.2. Create a chart

1. <Open the **Event Visualizer** app and select a chart type.
2. In the menu to the left, select the meta data you want to analyse.
3. Click **Layout** and arrange the dimensions.

You can keep the default selection if you want.

4. Click **Update**.

## 11.3. Select a chart type

The **Event Visualizer** app has eight different chart types, each with different characteristics. To select a chart type:

1. In **Chart type**, click the chart type you need.

**Table 11.1. Chart types**

Chart type	Description
Column chart	<p>Displays information as vertical rectangular columns with lengths proportional to the values they represent.</p> <p>Useful when you want to, for example, compare performance of different districts.</p>
Stacked column chart	Displays information as vertical rectangular columns, where bars representing multiple categories are stacked on top of each other.

Chart type	Description
	Useful when you want to, for example, display trends or sums of related data elements.
Bar chart	Same as column chart, only with horizontal bars.
Stacked bar chart	Same as stacked column chart, only with horizontal bars.
Line chart	Displays information as a series of points connected by straight lines. Also referred to as time series.  Useful when you want to, for example, visualize trends in indicator data over multiple time periods.
Area chart	Is based on line chart, with the space between the axis and the line filled with colors and the lines stacked on top of each other.  Useful when you want to compare the trends of related indicators.
Pie chart	Circular chart divided into sectors (or slices).  Useful when you want to, for example, visualize the proportion of data for individual data elements compared to the total sum of all data elements in the chart.
Radar chart	Displays data on axes starting from the same point. Also known as spider chart.

2. Click **Update**.

## 11.4. Select dimension items

An event chart is always based on a program and you can do analysis based on a range of dimensions. For programs with category combinations, you can use program categories and category option group sets as dimensions for tables and charts. Each dimension item can have a corresponding filter. You select dimension items from the left-side menu.

1. Select data elements:

a. Click **Data**.

b. Select a program and a program stage.

The data elements associated with the selected program are listed under **Available**. Each data element acts as a dimension.

c. Select the data elements you need by double-clicking their names.

After selecting a data element, it is visible under **Selected data items**.

d. (Optional) For each data element, specify a filter with operators such as "greater than", "in" or "equal" together with a filter value.

2. Select periods.

a. Click **Periods**.

b. Select one or several periods.

You have three period options: relative periods, fixed periods and start/end dates. You can combine fixed periods and relative periods in the same chart. You cannot combine fixed periods and relative periods with start/end dates in the same chart. Overlapping periods are filtered so that they only appear once.

- Fixed periods: In the **Select period type** box, select a period type. You can select any number of fixed periods from any period type. Fixed periods can for example be "January 2014".
- Relative periods: In the lower part of the **Periods** section, select as many relative periods as you like. The names are relative to the current date. This means that if the current month is March and you select **Last month**, the month of February is included in the chart. Relative periods has the advantage that it keeps the data in the report up to date as time goes.
- Start/end dates: In the list under the **Periods** tab, select **Start/end dates**. This period type lets you specify flexible dates for the time span in the report.

3. Select organisation units.

- a. Click **Organisation units**.
- b. Click the gearbox icon.
- c. Select a **Selection mode** and an organisation unit.

There are three different selection modes:

**Table 11.2. Selection modes**

Selection mode	Description
<b>Select organisation units</b>	<p>Lets you select the organisation units you want to appear in the chart from the organization tree.</p> <p>Select <b>User org unit</b> to disable the organisation unit tree and only select the organisation unit that is related to your profile.</p> <p>Select <b>User sub-units</b> to disable the organisation unit tree and only select the sub-units of the organisation unit that is related to your profile.</p> <p>Select <b>User sub-x2-units</b> to disable the organisation unit tree and only select organisation units two levels down from the organisation unit that is related to your profile.</p> <p>This functionality is useful for administrators to create a meaningful "system" favorite. With this option checked all users find their respective organisation unit when they open the favorite.</p>
<b>Select levels</b>	<p>Lets you select all organisation units at one or more levels, for example national or district level.</p> <p>You can also select the parent organisation unit in the tree, which makes it easy to select for example, all facilities inside one or more districts.</p>
<b>Select groups</b>	<p>Lets you select all organisation units inside one or several groups and parent organisation units at the same time, for example hospitals or chiefdoms.</p>

4. Click **Update**.

## 11.5. Select series, category and filter

You can define which data dimension you want to appear as series, category and filter. Each data element appears as individual dimensions and can be placed on any of the axes. Series and category panels can only have one dimension at the time.

### Note

Data elements of continuous value types (real numbers/decimal numbers) can only be used as filters, and will automatically be positioned as filters in the layout dialog. The reason for this is that continuous number cannot be grouped into sensible ranges and used on columns and rows.

1. Click **Layout**.
2. Drag and drop the dimensions to the appropriate space. Only one dimension can be in each section.
3. Click **Update**.

## 11.6. Change the display of your chart

You can customize the display of an event report.

1. Click **Options**.
2. Set the options as required.

**Table 11.3. Chart options**

Option	Description	
<b>Data</b>	<b>Show values</b>	Displays values as numbers on top of each series.
	<b>Use 100% stacked values</b>	Displays 100 % stacked values in column charts.
	<b>Use cumulative values</b>	Displays cumulative values in line charts.
	<b>Hide n/a data</b>	Hides data tagged as N/A from the chart.
	<b>Include only completed events</b>	Includes only completed events in the aggregation process. This is useful when you want for example to exclude partial events in indicator calculations.
	<b>Hide empty categories</b>	<p>Hides the category items with no data from the chart.</p> <p><b>None:</b> doesn't hide any of the empty categories</p> <p><b>Before first:</b> hides missing values only before the first value</p> <p><b>After last:</b> hides missing values only after the last value</p>

<b>Option</b>	<b>Description</b>
	<p><b>Before first and after last:</b> hides missing values only before the first value and after the last value</p> <p><b>All:</b> hides all missing values</p> <p>This is useful for example when you create column and bar charts.</p>
	<p><b>Trend line</b></p> <p>Displays the trend line which visualizes how your data evolves over time. For example if performance is improving or deteriorating. Useful when periods are selected as category.</p>
	<p><b>Target line value/title</b></p> <p>Displays a horizontal line and title (optional) at the given domain value. Useful for example when you want to compare your performance to the current target.</p>
	<p><b>Base line value/title</b></p> <p>Displays a horizontal line and title (optional) at the given domain value. Useful for example when you want to visualize how your performance has evolved since the beginning of a process.</p>
	<p><b>Sort order</b></p> <p>Allows you to sort the values on your chart from either low to high or high to low.</p>
	<p><b>Output type</b></p> <p>Defines the output type. The output types are <b>Event</b>, <b>Enrollment</b> and <b>Tracked entity instance</b>.</p>
	<p><b>Program status</b></p> <p>Filters data based on the program status: <b>All</b>, <b>Active</b>, <b>Completed</b> or <b>Cancelled</b>.</p>
	<p><b>Event status</b></p> <p>Filters data based on the event status: <b>All</b>, <b>Active</b>, <b>Completed</b>, <b>Scheduled</b>, <b>Overdue</b> or <b>Skipped</b>.</p>
<p><b>Axes</b></p>	<p><b>Range axis min/max</b></p> <p>Defines the maximum and minimum value which will be visible on the range axis.</p>
	<p><b>Range axis tick steps</b></p> <p>Defines the number of ticks which will be visible on the range axis.</p>
	<p><b>Range axis decimals</b></p> <p>Defines the number of decimals which will be used for range axis values.</p>
	<p><b>Range axis title</b></p> <p>Type a title here to display a label next to the range axis (also referred to as the Y axis). Useful when you want to give context information to</p>

Option	Description
	the chart, for example about the unit of measure.
	<b>Domain axis title</b> Type a title here to display a label below the domain axis (also referred to as the X axis). Useful when you want to give context information to the chart, for example about the period type.
<b>General</b>	<b>Hide chart legend</b> Hides the legend and leaves more room for the chart itself.
	<b>Hide chart title</b> Hides the title (default or custom) of your chart.
	<b>Chart title</b> Type a title here to display a custom title above the chart. If you don't enter a title, the default title is displayed.
	<b>Hide chart subtitle</b> Hides the subtitle of your chart.
	<b>Chart subtitle</b> Type a subtitle here to display a custom subtitle above the chart but below the title. If you don't enter a subtitle, no subtitle is displayed in the chart.

3. Click **Update**.

## 11.7. Download a chart as an image or a PDF

After you have created a chart you can download it to your local computer as an image or PDF file.

1. Click **Download**.
2. Under **Graphics**, click **PNG (.png)** or **PDF (.pdf)**.

The file is automatically downloaded to your computer. Now you can for example embed the image file into a text document as part of a report.

## 11.8. Download chart data source

You can download the data source behind a chart in HTML, JSON, XML, Microsoft Excel or CSV formats. The data document uses identifiers of the dimension items and opens in a new browser window to display the URL of the request to the Web API in the address bar. This is useful for developers of apps and other client modules based on the DHIS2 Web API or for those who require a plain data source, for instance for import into statistical packages.

To download plain data source formats:

1. Click **Download**.
2. Under **Plain data source**, click the format you want to download.

**Table 11.4. Available formats**

Format	Description
HTML	Creates HTML table based on selected meta data

Format	Description
JSON	Downloads data values in JSON format based on selected meta data
XML	Downloads data values in XML format based on selected meta data
Microsoft Excel	Downloads data values in Microsoft Excel format based on selected meta data
CSV	Downloads data values in CSV format based on selected meta data

## 11.9. Manage favorites

Saving your charts or pivot tables as favorites makes it easy to find them later. You can also choose to share them with other users as an interpretation or display them on the dashboard.

You view the details and interpretations of your favorites in the **Pivot Table**, **Data Visualizer**, **Event Visualizer**, **Event Reports** apps. Use the **Favorites** menu to manage your favorites.

### 11.9.1. Open a favorite

1. Click **Favorites > Open**.
2. Enter the name of a favorite in the search field, or click **Prev** and **Next** to display favorites.
3. Click the name of the favorite you want to open.

### 11.9.2. Save a favorite

1. Click **Favorites > Save as**.
2. Enter a **Name** and a **Description** for your favorite.
3. Click **Save**.

### 11.9.3. Rename a favorite

1. Click **Favorites > Rename**.
2. Enter the new name for your favorite.
3. Click **Update**.

### 11.9.4. Write an interpretation for a favorite

An interpretation is a link to a resource with a description of the data at a given period. This information is visible in the **Dashboard** app. To create an interpretation, you first need to create a favorite. If you've shared your favorite with other people, the interpretation you write is visible to those people.

1. Click **Favorites > Write interpretation**.
2. In the text field, type a comment, question or interpretation. You can see this information in the **Dashboard** app.
3. Search for a user group that you want to share your favorite with, then click the + icon.
4. Change sharing settings for the user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.

- **None:** The public won't have access to the object. This setting is only applicable to **Public access**.

5. Click **Share**.

### 11.9.5. Create a link to a favorite

1. Click **Favorites > Get link**.

2. Select one of the following:

- **Open in this app:** You get a URL for the favorite which you can share with other users by email or chat.
- **Open in web api:** You get a URL of the API resource. By default this is an HTML resource, but you can change the file extension to ".json" or ".csv".

### 11.9.6. Delete a favorite

1. Click **Favorites > Delete**.

2. Click **OK**.

### 11.9.7. View interpretations based on relative periods

To view interpretations for relative periods, such as a year ago:

1. Open a favorite with interpretations.
2. Click **>>>** in the top right of the workspace.
3. Click an interpretation. Your chart displays the data and the date based on when the interpretation was created. To view other interpretations, click them.

## 11.10. Visualize a chart as a pivot table

When you have made a chart you can open it as a pivot table:

Click **Chart > Open this chart as table**.

# Chapter 12. Control data quality

## 12.1. About data quality checks

The **Data Quality** app contains tools to validate the accuracy and reliability of the data in the system. You can verify the data quality with the help of validation rules and various statistical checks. Data quality has different dimensions including:

Dimension	Description
Correctness	Data should be within the normal range for data collected at that facility. There should be no gross discrepancies when compared with data from related data elements.
Completeness	Data for all data elements for all reporting organisation units should have been submitted.
Consistency	Data should be consistent with data entered during earlier months and years while allowing for changes with reorganization, increased work load, etc. and consistent with other similar facilities.
Timeliness	All data from all reporting organisation units should be submitted at the appointed time.

You can verify data quality in different ways, for example:

- At point of data entry, DHIS2 can check the data entered to see if it falls within the minimum maximum value ranges of that data element (based on all previous data registered).
- By defining validation rules, which can be run once the user has finished data entry. The user can also check the entered data for a particular period and organization unit(s) against the validation rules, and display the violations for these validation rules.
- By analysing data sets, that is, examine gaps in the data.
- By data triangulation, that is, comparing the same data or indicator from different sources.

## 12.2. Validation rule analysis

### 12.2.1. About validation rule analysis

A validation rule is based on an expression which defines a relationship between data element values. The expression forms a condition which should assert that certain logical criteria are met.

The expression consist of:

- a left side
- a right side
- an operator

#### Example 12.1.

A validation rule could assert that "Suspected malaria cases tested"  $\geq$  "Confirmed malaria cases".

The validation rule analysis tests validation rules against the data registered in the system. Validation violations are reported when the condition defined in the validation rule expression is not met, which means when the condition is false.

You can configure a validation rule analysis to automatically send out information about validation violations to selected user groups. These messages are called *validation notifications* and you create them in the **Maintenance** app. Validation notifications are sent via the internal DHIS2 messaging system.

## 12.2.2. Workflow

1. In the **Maintenance** app, create validation rules and validation rule groups.
2. (Optional) In the **Maintenance** app, create validation notifications.
3. Run the validation rule analysis, either automatically or manually.
  - In the **Data Administration** app, you schedule the validation rule analysis to run automatically for all validation rules included in one or several validation notifications. After the system has run the analysis, you'll see the validation violations (if any) in the validation notifications sent via the internal DHIS2 messaging system.
  - In the **Data Quality** app, you run the validation rule analysis manually for selected validation rules. After the analysis process has finished, you'll see a list of validation violations (if any).

## 12.2.3. Schedule a validation rule analysis to run automatically

### Note

Only validation rules that are included in one or several validation notifications will be a part of the validation rule analysis. If there's no corresponding validation notification for a validation rule, the system has nowhere to send the validation violations.

1. Verify that you have created all the validation rules, validation rule groups and validation notifications you need.
2. Open the **Data Administration** app and click **Scheduling**.
3. If scheduling is active, click **Stop**.
4. In the **Data monitoring** section, select **All daily**.
5. Click **Start**.

## 12.2.4. Run a validation rule analysis manually

The screenshot shows the 'Validation Rule Analysis' page in the DHIS2 Data Analysis module. The left sidebar lists various analysis types. The main area has a 'Run validation' button and a 'Select parameters' section with date range and validation rule group inputs. Below is a 'Select parent organisation unit' dropdown menu showing a tree structure of districts in Sierra Leone, with 'Bo' and 'Baoma' specifically highlighted in orange. A 'Validate' button is at the bottom.

1. Verify that you have created all the validation rules, validation rule groups and validation notifications you need.
2. Open the **Data Quality** app and click **Validation rule analysis**.
3. Select **Start date** and **End date**.
4. Select which **Validation rule group** you want to include in the analysis.

You can select all validation rules or all validation rules from a single validation rule group.

5. (Optional) Select **Send notifications** to trigger validation notifications.

## Note

If you want to send out validation notifications, you must first create them in the **Maintenance** app.

6. Select a **Parent organisation unit**.

7. Click **Validate**.

The analysis process duration depends on the amount of data that is being analysed. If there are no violations of the validation rules, you'll see a message saying *Validation passed successfully*. If there are validation violations, they will be presented in a list.

Run validation <small>?</small>

Gerehun CHC	September 2015	Medium	Injectable Antibiotics balance + ordered quantity is lower than the average consumption for last 10 months. Please increase your order to an appropriate quantity.	46.0	>=	579.3
Golu MCHP	September 2015	Medium	ANC 2 cannot be higher than ANC 1	32.0	<=	13.0

8. (Optional) Click the show details icon to get more information about a validation violation. In the pop-up window you'll find information about the data elements included in the validation rules and their corresponding data values. You can use this information to identify the source of the validation rule violation.

9. (Optional) Click **Download as PDF**, **Download as Excel** or **Download as CSV** to download the validation violations list in PDF, Excel or CSV formats.

## 12.2.5. See also

- [Manage validation rules](#)
- [Data Administration app](#)

## 12.3. Standard deviation outlier analysis

### 12.3.1. About standard deviation outlier analysis

The standard deviation outlier analysis identifies values that are numerically distant from the rest of the data. The analysis is based on the standard normal distribution. The system

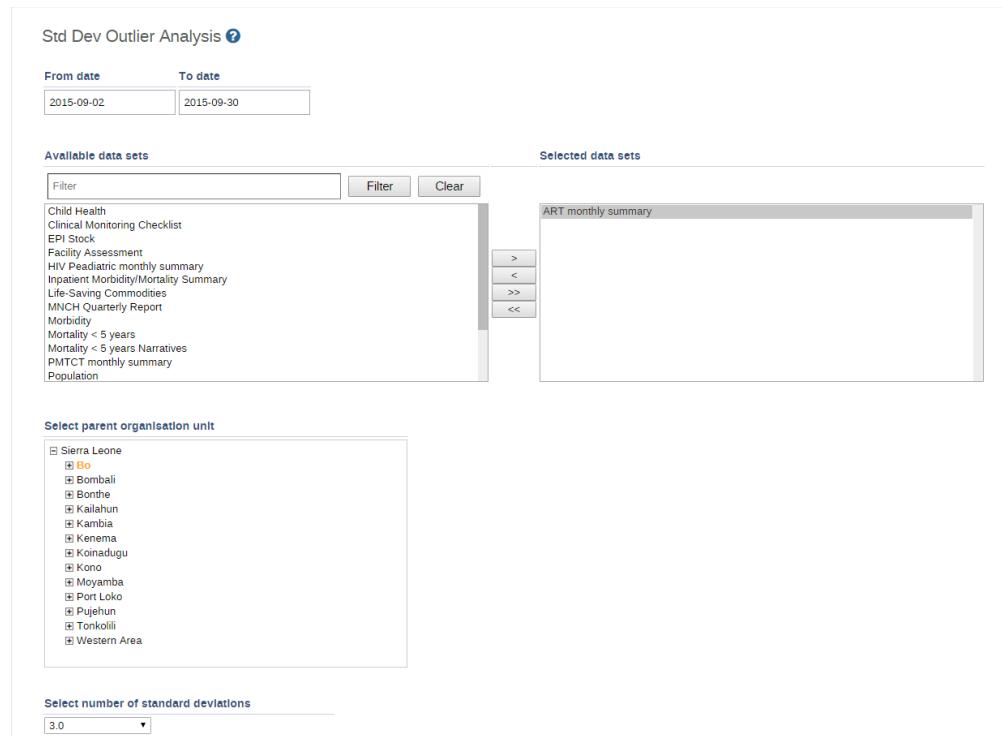

calculates the average, based on values since the beginning of time, for one particular combination of organisation unit, data element, category option combination and attribute option combination. Outliers can occur by chance but often indicate a measurement error or a heavy-tailed distribution which leads to very high numbers. You should investigate measurement errors and try to correct them before you discard them from the analysis.

## Warning

It's not recommended to use tools or interpretations that assume a normal distribution for heavy-tailed distributions.

For example: the standard deviation outlier analysis is not an appropriate tool when you expect huge seasonal variations in the data.

### 12.3.2. Run a standard deviation outlier analysis

1. Open the **Data Quality** app and click **Std dev outlier analysis**.
2. Select **From date** and **To date**.
3. Select data set(s).
4. Select **Parent organisation unit**.

All children of the organisation unit will be included. The analysis is made on raw data "under" the parent organisation unit, not on aggregated data.

5. Select a number of standard deviations.

This refers to the number of standard deviations the data is allowed to deviate from the mean before it is classified as an outlier.

6. Click **Start**.

The analysis process duration depends on the amount of data that is being analysed. If there are standard deviations outliers, they will be presented in a list.

Std Dev Outlier Analysis <a href="#">?</a>						
119 values found						
Data element	Organisation unit	Period	Min	Value	Max	Mark
Albendazole given at ANC (2nd trimester) Fixed	Ngelehung CHC	June 2017	9	23	22	
Albendazole given at ANC (2nd trimester) Fixed	Ngelehung CHC	February 2017	9	8	22	
ANC 1st visit Fixed	Ngelehung CHC	April 2017	8	7	21	
ANC 1st visit Outreach	Njandama MCHP	February 2017	1	5	4	
ANC 1st visit Outreach	Njandama MCHP	May 2017	1	5	4	
ANC 2nd visit Fixed	Njandama MCHP	April 2017	1	21	19	
ANC 2nd visit Outreach	Njandama MCHP	February 2017	0	9	7	
ANC 2nd visit Outreach	Njandama MCHP	July 2017	0	8	7	
ANC 3rd visit Fixed	Ngelehung CHC	February 2017	-4	45	39	
ANC 3rd visit Fixed	Ngelehung CHC	March 2017	-4	44	39	
ANC 3rd visit Fixed	Njandama MCHP	July 2017	-2	21	13	

For each outlier, you'll see the data element, organisation unit, period, minimum value, actual value and maximum value. The minimum and maximum values refer to the border values derived from the number of standard deviations selected for the analysis.

### Tip

Click the star icon to mark an outlier value for further follow-up.

## 12.3.3. Modify a standard deviation outlier value

You can modify an outlier value directly in the analysis result list:

1. In the value column, click inside the field that contains the value you want to change.
2. Enter a value and then navigate away from that field either by clicking tab or anywhere outside the field.

The system provides an alert if the value is still outside the defined minimum and maximum values, but the value will be saved in any case. The field will have a red background color if the value is outside the range, and a green if inside.

## 12.4. Minimum maximum outlier analysis

### 12.4.1. About minimum maximum value based outlier analysis

You can verify the data quality at the point of data entry by setting a minimum maximum value range for each data element. You create the value ranges manually or generate them automatically.

The auto-generated minimum maximum value range is suitable only for normally distributed data. DHIS2 will determine the arithmetic mean and standard deviation of all values for a given

data element, category option, organisation unit and attribute combination. Then the system will calculate the minimum maximum value range based on the **Data analysis std dev factor** specified in the **System Settings** app.

For data which is highly-skewed or zero inflated (as is often the case with aggregate data), the values which DHIS2 auto-generates may not provide an accurate minimum maximum value range. This can lead to excessive false violations, for example if you analyse values related to seasonal diseases.

## Note

Minimum maximum value ranges are calculated across all attribute combination options for a given data element, category option and organisation unit combination.

### 12.4.2. Workflow

1. Create a minimum maximum value range, either automatically or manually.
  - In the **Data Administration** app, you generate value ranges automatically.
  - In the **Data Entry** app, you set value ranges manually for each field.
2. In the **Data Quality** app, run the **Min-max outlier analysis**.

### 12.4.3. Configure a minimum maximum outlier analysis

#### 12.4.3.1. Create minimum maximum value range automatically

## Note

Auto-generated minimum maximum value ranges can be useful for many situations, but it's recommended to verify that the data is actually normally distributed prior to using this function.

You generate minimum maximum value ranges calculated by data set in the **Data Administration** app. The new value ranges override any value ranges that the system has calculated previously.

#### 1. Set the **Data analysis std dev factor**:

- a. Open the **System Settings** app, and click **General**.
- b. In the **Data analysis std dev factor** field, enter a value.

This sets the number of standard deviations to use in the outlier analysis. The default value is 2. A high value will catch less outlier values than a low value.

#### 2. Open the **Data Administration** app and click **Min-max value generation**.

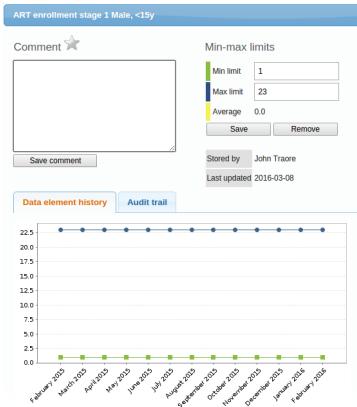

#### 3. Select data set(s).

#### 4. Select an **Organisation unit**.

## 5. Click **Generate**.

New minimum maximum value ranges for all data elements in the selected data sets for all organisation units (including descendants) of the selected organisation units are generated.

### 12.4.3.2. Create minimum maximum value range manually

1. In the **Data Entry** app, open a data entry form.
2. Double-click the field for which you want to set the minimum maximum value range.
3. Enter **Min limit** and **Max limit**.
4. Click **Save**.

If values don't fall within the new value range the next time you enter data, the data entry cell will appear with an orange background.

5. (Optional) Type a comment to explain the reason for the discrepancy, for example an event at a facility which may have generated a large number of clients.
6. (Optional) Click **Save comment**.

#### Tip

Click the star icon to mark the value for further follow-up.

### 12.4.3.3. Delete minimum maximum value range

The screenshot shows the 'Min-Max Value Generation' screen in the Data Administration app. On the left, under 'Available data sets', there is a list of various data elements such as 'ART monthly summary', 'Child Health', 'Clinical Monitoring Checklist', 'EPI Stock', 'Facility Assessment', 'HIV Prevalence monthly summary', 'Inpatient Morbidity/Mortality Summary', 'Life-Saving Commodities', 'MCH Quarterly Report', 'Morbidity', 'Mortality < 5 years', 'Mortality > 5 years Narratives', 'PMTCT monthly summary', 'Population', 'Project Management', 'Reproductive Health', 'Staffing', 'TB Facility reporting Form', and 'TB/HIV (VCCT) monthly summary'. On the right, under 'Organisation Unit Selection', there is a list of organization units in Sierra Leone, each preceded by a checkbox: Bo, Bonthe, Kailahun, Kambia, Kenema, Kere, Kono, Moyamba, Port Loko, Pujehun, Tonkolili, and Western Area. At the bottom, there are 'Generate' and 'Remove' buttons.

You can permanently delete all minimum maximum value ranges for selected data sets and organisation units in the **Data Administration** app.

1. Open the **Data Administration** app and click **Min-max value generation**.
2. Select data set(s).
3. Select an **Organisation unit**.
4. Click **Remove**.

## 12.4.4. Run a minimum maximum outlier analysis

Min-Max Outlier Analysis [?](#)

From date	To date

Click the star icon to mark the value for further follow-up.

## 12.5. Follow-up analysis

### 12.5.1. About follow-up analysis

The follow-up analysis creates a list of all data values marked for follow-up. You can mark a data value for follow-up in the **Data Entry** app and in the result list you get from a standard deviation outlier or minimum maximum outlier analysis.

### 12.5.2. Create list of data values marked for follow-up

1. Open the **Data Quality** app and click **Follow-up analysis**.
2. Select an **Organisation unit**.

The analysis process duration depends on the amount of data that is being analysed. If there are data values marked for follow-up, they will be presented in a list.

#### Tip

Click the star icon to remove the follow-up tag from the data value.

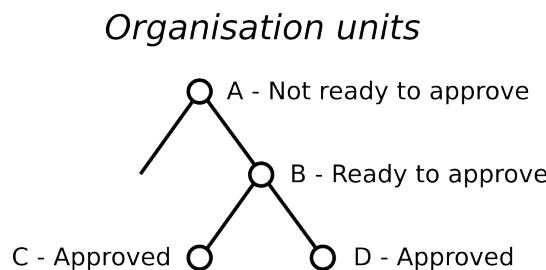

# Chapter 13. Data approval

DHIS2 has an optional feature that allows authorized users to approve data that has been entered. It allows data to be reviewed and approved at selected levels in the organisation unit hierarchy, so the approval follows the structure of the hierarchy from lower levels to higher levels.

Data is approved for a combination of (a) period, (b) organisation unit and (c) workflow. Data may be approved for the organisation unit for which it is entered, as well as for higher-level organisation units to which the data is aggregated. As part of system settings, you can choose the organisation unit level(s) at which data is approved. It can be approved at higher levels only after it has been approved for all that organisation unit's descendants at lower levels for the same workflow and period. When you approve a workflow, it approves data for any data sets that have been assigned to that workflow.

After a period, organisation unit and workflow combination has been approved, data sets associated with that workflow will be locked for that period and organisation unit, and any further data entry or modification will be prohibited unless it is first un-approved.

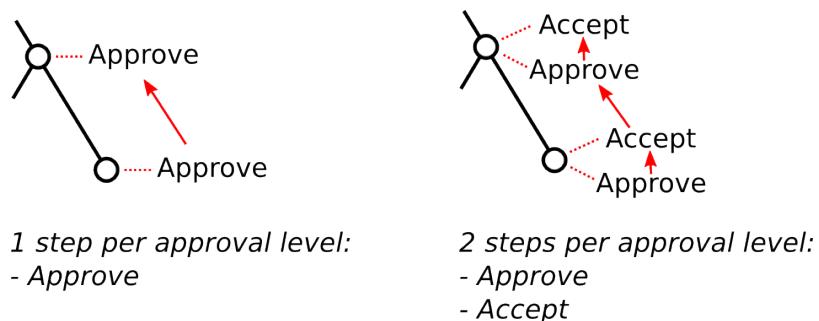

For example, the following diagram illustrates that data has already been approved for organisation units C and D, for a given period and workflow. It may now be approved for organisation unit B for the same period and workflow. But it is not ready to be approved for organization unit A. Before it can be approved for organisation unit A, it must be approved for B, and for any other children of organisation unit A, for that period and workflow.

**Figure 13.1. Approving at organisation units**

## 13.1. Approving and accepting

DHIS2 supports two different types of approval processes: either a one-step process where the data is approved at each level, or a two-step process where data is first approved and then accepted at each level. This is illustrated in the following diagram:

**Figure 13.2. Approving and accepting**

In the one-step process, data is approved at one level, and then approved at the next higher level. Until it is approved at the next higher level, it may be unapproved at the first level. (For

example, if the data was approved my mistake, this allows the approver to undo their mistake.) Once the data is approved at the next higher level, it may not be unapproved at the lower level unless it is first unapproved at the higher level.

In the two-step process, data is approved at one level, and then the approval is accepted at the same level. This acceptance is done by a user who is authorized to approve data at the next higher level. Once the data is accepted, it may not be changed or unapproved unless it is first *unaccepted*.

The two-step process is not required by DHIS2. It is an optional step for a user reviewing data at the next higher level. It has the benefit of locking the acceptance from the level below, so reviewer does not have to worry that the data could be changing from below while it is being reviewed. It can also be used by the higher-level user to keep track of which lower-level data has already been reviewed.

## 13.2. Authorities for approving data

To approve data, you must be assigned a role containing one of these authorities:

- **Approve data** - You may approve data for the organisation unit(s) to which you are assigned. Note that this authority does not allow you to approve data for lower-levels below the organisation unit(s) to which you are assigned. This is useful to separate the users authorized to approve at one level from the users authorized to approve at levels below.
- **Approve data at lower levels** - Allows you to approve data for all lower levels below the organisation units assigned to you. This is useful if, for example, you are a district-level user whose role includes approving the data for all the facilities within that district, but not for the district itself. If you are assigned this as well as the *Approve data* authority, you may approve data at the level of the organisation unit(s) to which you have been assigned, and for any level below.
- **Accept data at lower levels** - Allows you to accept data for the level just below the organisation unit(s) assigned to you. This authority can be given to the same users as *Approve data*. Or it may be given to different users, if you want to have some users who accept data from the level below, and a different set of users who approve data to go up to the next level above.

## 13.3. Configuring data approval

In the *Settings* section under *System Approval Settings* you can specify the levels at which you want to approve data in the system. Click the Add new button on this page and select the organisation unit level at which you want approvals. It will be added to the list of approval settings. You may configure the system for approving data at every organisation unit level, or only at selected organisation unit levels.

Note that when you add a new approval level, you may optionally choose a Category option group set. This feature is discussed later in this chapter.

Also under *System Approval Settings*, you can define the workflows that will be used for approving data. Each workflow can be associated with one or more approval levels. Any two workflows may operate at all the same approval levels as each other, some of the same and some different levels, or completely different levels.

If you want data for a data set to be approved according to a workflow, then assign the workflow to the data set when you add or edit the data set. If you do not want data for a data set to be subject to approval, then do not assign any workflow to that data set. For data sets that you want to approve at the same time as each other, assign them to the same workflow. For data sets that you want to approve independently, assign each data set to its own workflow.

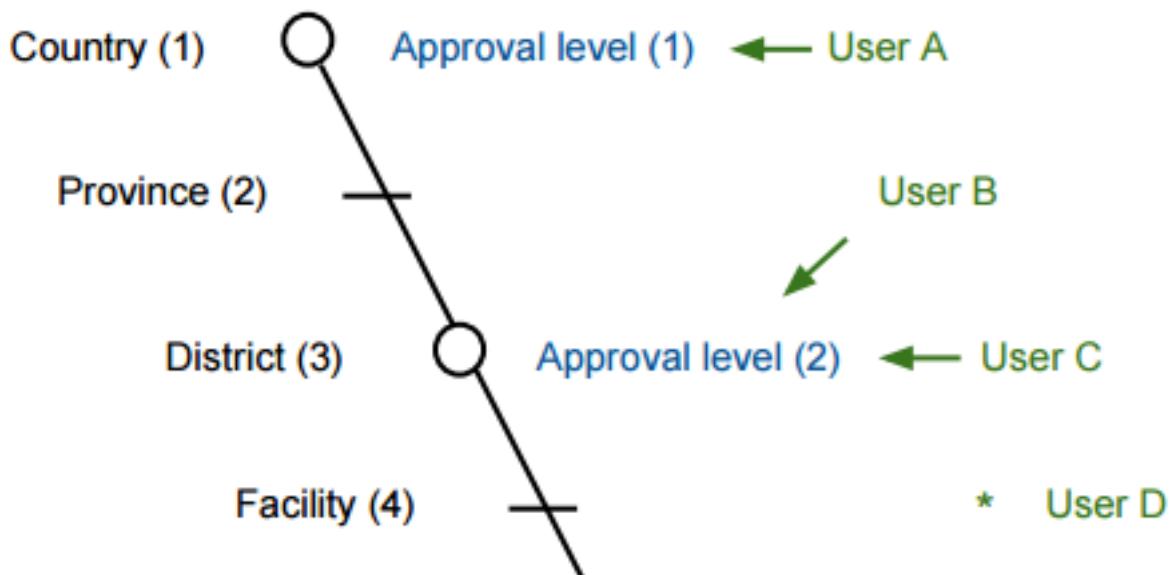

On the *System Approval Settings* page, you may select the option *Hide unapproved data in analytics* to hide unapproved data in reports, pivot table, data visualizer and GIS. If this option is checked, unapproved data will be hidden from users assigned to higher-level organisation units compared to where approval is required. Users who are assigned to organisation units where data is ready for approval can still view the data, as can users assigned to higher-level organisation units if they have the *Approve data at lower levels* authority. If this option is not checked, then all data is shown whether approved or not.

### 13.4. Data visibility

If the option *Hide unapproved data in analytics* is enabled, data will be hidden from viewing by users associated with higher levels. When determining whether a data record should be hidden for a specific user, the system associates a user with a specific approval level and compares it to the level to which the data record has been approved up to. A user is associated with the approval level which matches the level of the organisation unit(s) she is linked to, or if no approval level exists at that level, the next approval level linked to an organisation unit level below herself. A user will be allowed to see data which has been approved up to the level immediately below her associated approval level. The rationale behind this is that a user must be able to view the data that has been approved below so that she can eventually view and approve it herself.

Note that if the user has been granted the *View unapproved data* or the *ALL* authority she will be able to view data irrespective of the approval status.

*Lets consider the following example:* There are four organisation unit levels, with approval levels associated with level 2 and 4. *User A* at country level (1) gets associated with approval level 1 since the approval level exists at the same level as the organisation unit level. *User B* gets associated with approval level 2 since there is no approval level directly linked to her organisation unit level and approval level 2 is the immediate level below. *User C* gets associated with approval level 2. *User D* is below all approval levels which implies that she can see all data entered at or below her organisation unit level.

**Figure 13.3. Hiding of unapproved data**

Using this example, lets consider some scenarios:

- Data is entered at facility level: Only *User D* can see the data, as the data has not yet been approved at all.

- Data is approved by *User D* at facility level: Data becomes visible to User C and User B, as the data is now approved at their level.
- Data is approved by *User C* at district level: Data becomes visible to User A, as data is now approved at the level immediately below herself.

## 13.5. Approving data

To approve data, go to *Reports* and choose *Data Approval*. When this report shows data that is configured for approval, it shows the approval status of the data in the report. The approval status will be one of the following:

- **Waiting for lower level org units to approve** - This data is not yet ready to be approved, because it first needs to be approved for all the child organisation units to this organisation unit, for the same workflow and period.
- **Ready for approval** - This data may now be approved by an authorized user.
- **Approved** - This data has already been approved.
- **Approved and accepted** - This data has already been approved, and also accepted.

If the data you are viewing is in an approval state that can be acted upon, and if you have sufficient authority, one or more of the following actions will be available to you on the *Data Approval* form:

- **Approve** - Approve data that has not yet been approved, or that was formerly approved and has been unapproved.
- **Unapprove** - Return to an unapproved state data that has been approved or accepted.
- **Accept** - Accept data that has been approved.
- **Unaccept** - Return to an unaccepted (but still approved) state data that has been accepted.

In order to unapprove data for a given organisation unit, you must have the authority to approve data for that organisation unit or to approve data for a higher-level organisation unit to which that data is aggregated. The reason for this is as follows: If you are reviewing data for approval at a higher organisation unit level, you should consider whether the data at lower organisation units are reasonable. If all lower-level data looks good, you can approve the data at the higher level. If some lower-level data looks suspect, you can unapprove the data at the lower level. This allows the data to be reviewed again at the lower level, corrected if necessary, and re-approved up through the organisation unit levels according to the hierarchy.

## 13.6. Approving by category option group set

When defining an approval level, you specify the organisation unit level at which data will be approved. You may also optionally specify a category option group set. This is useful if you are using category option groups to define additional dimensions of your data, and you want approvals to be based on these dimensions. The following examples illustrate how this can be done within a single category option group set, and by using multiple category option group sets.

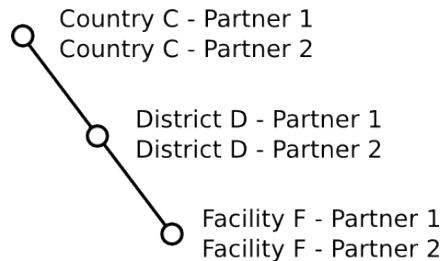

### 13.6.1. Approving by one category option group set

For example, suppose you define a category option group set to represent NGOs who serve as healthcare partners at one or more organisation units. Each category option group within this set represents a different partner. The category option group for Partner 1 may group together category options (such as funding account codes) that are used by that partner as a dimension of the data. So data entered by Partner 1 is attributed to a category option in Partner 1's category option group. Whereas data entered by partner 2 is attributed to a category option in Partner 2's category option group:

**Table 13.1. Example Category Option Groups**

Category option group set	Category option group	Category options
Partner	Partner 1	Account 1A, Account 1B
Partner	Partner 2	Account 2A, Account 2B

Each partner could enter data for their accounts independently of the other, for the same or different workflows, at the same or different facilities. So for example, data can be entered and/or aggregated at the following levels for each partner, independently of each other:

**Figure 13.4. Example category option groups**

### Tip

You can use the sharing feature on category options and category option groups to insure that a user can enter data (and/or see data) only for certain category options and groups. If you don't want users to see data that is aggregated beyond of their assigned category options and/or category option groups, you can assign *Selected dimension restrictions for data analysis*, when adding or updating a user.

You can optionally define approval levels for partner data within any or all of these organisation unit levels. For example, you could define any or all of the following approval levels:

**Table 13.2. Example Category Option Group Set approval levels**

Approval level	Organisation unit level	Category option group set
1	Country	Partner
2	District	Partner
3	Facility	Partner

## 13.6.2. Approving by multiple category option group sets

You can also define approval levels for different category option group sets. To continue the example, suppose that you have various agencies that manage the funding to the different partners. For example, Agency A funds accounts 1A and 2A, while Agency B funds accounts 1B and 2B. You could set up category option groups for Agency A, and Agency B, and make them both part of a category option group set called Agency. So you would have:

**Table 13.3. Example Multiple Category Option Group Sets**

Category option group set	Category option group	Category options
Partner	Partner 1	Account 1A, Account 1B
Partner	Partner 2	Account 2A, Account 2B
Agency	Agency A	Account 1A, Account 2A
Agency	Agency B	Account 1B, Account 2B

Now suppose that at the country level, you want each partner to approve the data entered by that partner. Once this approval is done, you want each agency to then approve the data from accounts that are managed by that agency. Finally, you want to approve data at the country level across all agencies. You could do this by defining the following approval levels:

**Table 13.4. Example Multiple Category Option Group Set approval levels**

Approval level	Organisation unit level	Category option group set
1	Country	
2	Country	Agency
3	Country	Partner

Note that multiple approval levels can be defined for the same organisation unit level. In our example, Partner 1 would approve country-wide data at approval level 3 from category options Account 1A and Account 1B. Next, Agency A would approve country-wide data at approval level 2 from category options Account 1A (after approval by Partner 1) and Account 2A (after approval by Partner 2.) Finally, after approval from all agencies, country-wide data can be approved at approval level 1 across all category options. Note that approval level 1 does not specify a category option group set, meaning that it is for approving data across all category options.

This example is meant to be illustrative only. You may define as many category option groups as you need, and as many approval levels as you need at the same organisation unit level for different category option group sets.

If you have multiple approval levels for different category option group sets at the same organisation unit level, you may change the approval ordering in the *Settings* section, under *System Approval Settings*. Just click on the approval level you wish to move, and select *Move up* or *Move down*. If you have an approval level with no category option groups set, it must be the highest approval level for that organisation unit level.

# Chapter 14. Using reporting functionality

## 14.1. Reporting functionality in DHIS2

The reporting module in DHIS2 provides a range of reporting alternatives, and this section will explain how to use them to view and analyse data. Another section explains how to configure and set up the various reporting tools.

**Standard reports:** Standard reports are built on pivot tables, but are more advanced in its design allowing for more cosmetics and styles. These reports can also combine multiple tables and charts in the same report and be made available as one-click reports that are very easy to use. These reports can be downloaded as PDF files which makes them ideal for printing as well as sharing offline.

**Dataset reports:** Dataset reports are simply a printer friendly way to look at the data entry forms with either raw or aggregated data (over time or place). The design used in data entry will be used also in the data set reports. This will work only for data sets that has a custom data entry form set up.

**Dashboard:** The fastest way to view your data. The dashboard can display up to four updated charts as well as shortcuts to your favourite reports, report tables, and map views. Each user can configure a personal dashboard.

**Data Visualizer:** Do flexible visualizations of your data as charts and data tables. Any number of indicators and data elements can be included. Several chart types are available, such as column, stacked column, line, area and pie charts. The charts can be saved in order to be easily retrieved later and can also be put on your personal dashboard. Charts can be downloaded as image and PDF files to your local computer.

**Orgunit distribution reports:** These reports are generated off the orgunit group set information and can show what types (and how many of each type) of health facilities that are located in a given area (any level in the hierarchy). These reports are automatically generated and display the information in both tables and charts, and downloads in PDF, excel, and CSV are available.

**Reporting rate summary:** These reports provide a nice overview of how many facilities that have submitted their data for a given dataset and period. Here you can get both the counts and the percentages showing the reporting rate for all or single data sets.

**Web-based pivot tables:** The built in pivot table tool is a web-based tool to display indicator data by orgunit and period in a typical pivot table view and allows for pivoting manipulations of the tables. It allows for large amounts of data to be downloaded offline for analysis as well.

**GIS:** Present and analyse your data using thematic maps. You can view both data elements and indicators and given that you have coordinates for all your orgunits you can drill down the hierarchy and view maps for all levels from country polygons to facility points. See the separate chapter on GIS for more details. All the map information is built into DHIS2 and all you need to do is to register coordinates for your organisation units and the maps will be available.

## 14.2. Using standard reports

You access the available reports by navigating to Apps->Reports. In the report menu in the left bar, click Standard Report. A list of all pre-defined reports will appear in the main window.

## Standard reports

The screenshot shows a 'Standard Report' interface. At the top, there is a search bar labeled 'Filter by name' with a 'Filter' and 'Clear' button, and a 'Add new' button. Below the search bar is a table with a header 'Name'. The first row in the table is highlighted in blue and contains the text 'ANC: 1st Visit Cumulative Chart'. A contextual menu is open over this row, listing options: 'Create', 'Sharing settings', 'Edit report' (with a checked checkbox), 'Remove', and 'Show details'. Other rows in the table include 'ANC: Coverages This Year', 'ANC: Overview Report (HTML-based)', 'ANC: Visits This Year', 'Feedback: Indicator Report', and 'Immunization: Overview (HTML-based)'. Below the table, there are sections for 'Immunization: Raw data by district and chiefdom (SQL-based)' and 'Nutrition: Breastfeeding and malnutrition'. At the bottom, there are pagination controls: 'No. of pages: 1', 'No. of rows per page: 50', 'Jump to page: 1', and 'Go'. Navigation arrows ('<<', '<', '1', '>', '>>') are also present.

You run/view a report by clicking on the name of the report and then selecting "Create" from the contextual menu. If there are any pre-defined parameters, you will see a report parameter window where you must fill in the values needed for orgunit and/or reporting month, depending on what has been defined in the underlying report table(s). Click on "Get Report" when you are ready. The report will either appear directly in your browser or be available as a PDF file for download, depending on your browser settings for handling PDF files. You can save the file and keep it locally on your computer for later use.

### 14.3. Using dataset reports

Dataset reports are printer friendly views of the data entry screen filled with either raw or aggregated data. These are only available for data sets that have custom data entry forms and not for default or section forms.

You can access data set reports from Apps->Reports.

A Criteria window will appear where you fill in the details for your report:

**Dataset:** The data set you want to display.

**Reporting period:** The actual period you want data for. This can be aggregated as well as raw periods. This means that you can ask for a quarterly or annual report even though the data set is collected monthly. A data set's period type (collection frequency) is defined in data set maintenance. First select the period type (Monthly, Quarterly, Yearly etc.) in the drop down next to Prev and Next buttons, and then select one of the available periods from the dropdown list below. Use Prev and Next to jump one year back or forward.

**Use data for selected unit only:** Use this option if you want a report for an orgunit that has children, but only want the data collected directly for this unit and not the data collected by its children. If you want a typical aggregated report for an orgunit you do not want to tick this option.

**Reporting Organisation unit:** Here you select the orgunit you want the report for. This can be at any level in the hierarchy as the data will be aggregated up to this level automatically (if you do not tick the option above).

When you are done filling in the report criteria you click on "Generate". The report will appear as HTML in a printer-friendly format. Use the print and save as functions in the browser to print or save (as HTML) the report. You can also export the data set report in Excel and PDF formats.

## 14.4. Using resources

The resource tool allows you to upload both files from your local computer to the DHIS server and to add links to other resources on the Internet through URLs. If cloud storage is configured for your system, resources will be saved there.

To create a new resource:

1. Open the **Reports** app and click **Resource**.
2. Click **Add new**.
3. Enter a **Name**.
4. Select a **Type: Upload file or External URL**.
5. Click **Save**.

## 14.5. Using reporting rate summary

Access the reporting rate summary from the Apps->Reports menu. Reporting rate summaries will show how many datasets (forms) that have been submitted by organisation unit and period. There are two methods available to calculate reporting rates (completeness):

- Based on complete data set registrations. A complete data set registration refers to a user marking a data entry form as complete, typically by clicking the complete button in the data entry screen, hereby indicating to the system that she considers the form to be complete. This is i.e. a subjective approach to calculating completeness.
- Based on compulsory data element: You can define any number of data elements in a data set to be compulsory. This implies that data values must be captured for all data elements which have been marked as compulsory in order for the data set to be considered complete. This is i.e. an objective approach to calculating completeness.

The reporting rate summary will for each row show a range of measures:

- Actual reports: Indicates the number of data entry complete registrations for the relevant data set.
- Expected reports: Indicates how many data entry complete registrations are expected. This number is based on the number of organisation units the relevant data set has been assigned to (enabled for data entry).
- Percent: The percentage of reports registered as complete based on the number expected.
- Reports on time: Same as actual reports, only reports registered as complete within the maximum number of days after the end of the reporting period. This number of days after reporting period can be defined per data set in the data set management.
- Percent on time: Same as percentage, only reports registered as complete on time used as numerator.

To run the report you can follow these steps:

- Select an orgunit from the tree.
- Select one of the completeness methods to use to calculate the reporting rates.

Select all or one data set. All will give you a report with all data sets for the selected organisation unit. A single data set will give you a report with completeness for all children of the selected organisation unit.

- Select a period type and a period from the list of available periods for that period type. Move back/forward one year by using the prev/next buttons.
- The report will then be rendered. Change any of the parameters above and the report will be updated automatically.

## Reporting rate summary

Reporting Rate Summary ?

Name	Actual Reports	Expected Reports	Percent	Reports On Time	Percent On Time
Moyamba	270	282	95.7	270	95.7
Bombali	284	297	95.6	284	95.6
Kenema	348	366	95.1	348	95.1
Kailahun	217	231	93.9	217	93.9

## 14.6. Using organisation unit distribution reports

You can access the Orgunit Distribution reports from the left side menu in the Apps->Reports.

Orgunit distribution reports are reports that show how the orgunits are distributed on various properties like type and ownership, and by geographical areas.

The result can be presented in a table-based report or in a chart.

### Running a report:

To run a report first select an orgunit in the upper left side orgunit tree. The report will be based on orgunits located under the selected orgunit. Then select the orgunit group set that you want to use, typically these are Type, Ownership, Rural/Urban, but can be any user-defined orgunit group set. Then you can click on either Get Report to get the table-based presentation or Get chart to get the same result in a chart. You can also download other format such as PDF, Excel and CSV.

### Orgunit distribution report

Organisation unit distribution report ?

## 14.7. Generate analytics tables

DHIS2 generates database tables which the system then uses as basis for various analytics functions. These tables are also valuable if you write advanced SQL reports. In the **Reports** app, you can execute the tables immediately or schedule them to be executed at regular intervals. This means that you can refresh recent analytics on demand and see updated pivot tables without waiting for all of the past years data to re-process.

### Note

You can also generate the tables through the web API. This task is typically performed by a system administrator.

1. Open the **Reports** app and click **Analytics**.
2. Select the parts of the analytics process you want to skip:
  - **Skip generation of resource tables**
  - **Skip generation of aggregate data and completeness data**
  - **Skip generation of event data**
  - **Skip generation of enrollment data**
3. Select **Number of last years of data to include**.
4. Click **Start export**.

# Chapter 15. Set user account preferences

In **User settings**, you can change the display language of DHIS2 and the language of the database. The database language is the translated content of the metadata, such as data elements and indicators. You can also choose a display style, and enable or disable SMS and email notifications. If you wish to, you can choose to display a short name, such as "Joe" in the analysis modules, rather than your full name.

In **User profile**, you can add personal information to your profile such as your email address, mobile phone number, date of birth and more. When you send messages, the person receiving the message can see these profile details.

In **Account settings**, you can reset your password.

# Chapter 16. Manage users, user roles and user groups

## 16.1. About user management

Multiple users can access DHIS2 simultaneously and each user can have different authorities. You can fine-tune these authorities so that certain users can only enter data, while others can only generate reports.

- You can create as many users, user roles and user groups as you need.
- You can assign specific authorities to each user.
- You can create multiple user roles each with their own authorities.
- You can assign user roles to users to grant the users the corresponding authorities.
- You can assign each user to organisation units. Then the user can enter data for the assigned organisation units.

**Table 16.1. User management terms and definitions**

Term	Definition	Example
Authority	A permission to perform one or several specific tasks	Create a new data element Update an organisation unit View a report
User	A person's DHIS2 user account	admin traore guest
User role	A group of authorities	Data entry clerk System administrator Antenatal care program access
User group	A group of users	Kenya staff Feedback message recipients HIV program coordinators

You manage users, user roles and user groups in the **Users** app.

**Table 16.2. Objects in the Users app**

Object type	Available functions
User	Create, edit, clone, disable, assign search organisation units, display by organisation unit, delete and show details
User role	Create, edit, share, delete and show details
User group	Create, edit, join, leave, share, delete and show details

## 16.1.1. About users

Each user in DHIS2 must have a user account which is identified by a user name. You should register a first and last name for each user as well as contact information, for example an email address and a phone number.

It is important that you register the correct contact information. DHIS2 uses this information to contact users directly, for example sending emails to notify users about important events. You can also use the contact information to share for example dashboards and pivot tables.

A user in DHIS2 is associated with an organisation unit. You should assign the organisation unit where the user works.

### Example 16.1.

When you create a user account for a district record officer, you should assign the district where he/she works as the organisation unit.

The assigned organisation unit affects how the user can use DHIS2:

- In the **Data Entry** app, a user can only enter data for the organisation unit she is associated with and the organisation units below that in the hierarchy. For instance, a district records officer will be able to register data for her district and the facilities below that district only.
- In the **Users** app, a user can only create new users for the organisation unit she is associated with in addition to the organisation units below that in the hierarchy.
- In the **Reports** app, a user can only view reports for her organisation unit and those below. (This is something we consider to open up to allow for comparison reports.)

An important part of user management is to control which users are allowed to create new users with which authorities. In DHIS2, you can control which users are allowed to perform this task. The key principle is that a user can only grant authorities and access to data sets that the user itself has access to. The number of users at national, province and district level are often relatively few and can be created and managed by the system administrators. If a large proportion of the facilities are entering data directly into the system, the number of users might become unwieldy. It is recommended to delegate and decentralize this task to the district officers, it will make the process more efficient and support the facility users better.

## 16.1.2. About user roles

A user role in DHIS2 is a group of authorities. An authority means the permission to perform one or more specific tasks.

### Example 16.2.

A user role can contain authorities to create a new data element, update an organisation unit or view a report.

A user can have multiple user roles. If so, the user's authorities will be the sum of all authorities and data sets in the user roles. This means that you can mix and match user roles for special purposes instead of only creating new ones.

A user role is associated with a collection of data sets. This affects the **Data Entry** app: a user can only enter data for the data sets registered for his/her user role. This can be useful when, for example, you want to allow officers from health programs to enter data only for their relevant data entry forms.

Recommendations:

- Create one user role for each position within the organisation.
- Create the user roles in parallel with defining which user is doing which tasks in the system.

- Only give the user roles the exact authorities they need to perform their job, not more. Only those who are supposed to perform a task should have the authorities to perform it.

### 16.1.3. About user groups

A user group is a group of users. You use user groups when you set up sharing of objects or notifications, for example push reports or program notifications.

See also:

[Sharing](#)

[Manage program notifications](#)

[Manage push reports](#)

## 16.2. Workflow

1. Define the positions you need for your project and identify which tasks the different positions will perform.
2. Create roughly one user role for each position.
3. Create users.
4. Assign user roles to the users.
5. Assign the users to organisation units.
6. Assign data sets to the user role.
7. (Optional) Group users in user groups.

### Tip

For users to be able to enter data, you must add them to both a data set and an organisational unit level.

## 16.3. Manage users

### 16.3.1. Create a user

The screenshot shows the DHIS2 mobile application interface. At the top, there is a blue header bar with the text "dhis2" on the left and "DHIS 2 Demo - Sierra Leone" in the center. On the right side of the header are three icons: a grid labeled "Apps", a person icon labeled "Profile", and a question mark icon. Below the header, the main screen has a light gray background. On the left, there is a vertical sidebar with a dark blue header containing the word "User". Underneath this, there are several menu items: "User by Organisation Unit", "User", "Self Registered User", "User Role", and "Delete Current User". To the right of the sidebar, the main content area has a white header with the text "Users" and a question mark icon. Below this, there are four cards, each representing a different user type. The first card, "User by Organisation Unit", has a yellow profile icon and a brief description: "Create, modify, view and delete users which are assigned to a given organisation unit." The second card, "User", also has a yellow profile icon and a more detailed description: "Create, modify, delete and view all users. A user is associated with user roles and an organisation unit." This card is highlighted with a gray background. The third card, "Self Registered User", has a yellow profile icon and a description: "View and manage users who have self-registered for a personal user account in the system." The fourth card, "User Role", has a yellow profile icon and a description: "Create, modify, view and delete user roles. A user role has a set of authorities in the system." The overall layout is clean and organized, typical of a mobile application interface.

1. Open the **Users** app and click **User**.

2. Click **Add new**.

3. Select whether you want to fill in all the personal user information, or invite the user by email to complete the rest of the user information:

- **Create account with user details**

The screenshot shows the DHIS2 interface for creating a new user. At the top, there's a blue header bar with the text "dhis2 District Health Information Software 2". Below the header, a sub-header says "Create new user". A dropdown menu labeled "Action" is set to "Create account with user details". The main area is titled "Details" and contains the following fields with red asterisks indicating they are required:

- Username \*
- Password \*
- Retype password \*
- Surname \*
- First name \*
- E-mail
- OpenID
- Mobile phone number

Choose this option if you would like to enter all the details of the new user such as name, password, etc.

Enter the following information: user name, password, surname, first name, email, OpenID account (if any) and mobile phone number (if any).

After you've created the user, the account is ready for the user to use with the user name and password that you provide.

- **Email invitation to create account**

The screenshot shows the DHIS2 interface for creating a new user, similar to the previous one but with a different action. The "Action" dropdown is now set to "Email invitation to create account". The "Details" section contains the following fields:

- E-mail \*
- Username

Choose this option if you want to send an invitation by email to the user. Then she/he must return to DHIS2 and finish setting up their user account. The account that the user finishes setting up will be limited according to how you configure the account.

## Note

You may not select this option to create an account with "critical" system authorities such as All, Scheduling Administration, Perform maintenance tasks, Merge organisation units, Eliminate duplicate data elements, SQL View Management, Change system settings, and List, Add or Delete user roles.

In order to use this feature "Enable email message notifications" in SystemSettings -> Messaging should be checked.

Enter the email address to which the invitation should be sent. If you want to, you may also enter the user name that the account will have. If you leave the user name empty, then the user may choose their own user name when they respond to the invitation (as long as it is not taken already for another user.)

After you've created the user, the system sends two emails to the address you provided. One contains a unique web link by which the user can return to the system and activate

their account by entering the rest of their user information. The other email contains a unique code that they must enter into the system in order to complete the registration, after following the link in the first email. The user must finish setting up the account within three months, after that the invitation becomes invalid.

#### 4. Select an **Interface language**.

You can select a language into which fixed elements of the DHIS2 user interface have been translated.

#### 5. Select a **Database language**.

You can select a language into which implementation-supplied items have been translated in the database, for example data element names or organisation unit level names.

#### 6. In the **Available roles** section, double-click the user roles you want to assign to the user.

#### 7. Select **Data capture and maintenance organisation units**.

The screenshot shows a configuration interface for selecting user roles and organization units. At the top, there are dropdown menus for 'Interface language' (set to English) and 'Database language' (set to [Use database locale / no translation]). Below these are two main sections: 'Available roles' and 'Selected roles'. The 'Available roles' section contains a search bar and a list of five roles: Data Entry Clerk, M & E Officer, Superuser, System Administrator, and User Administrator. The 'Selected roles' section is currently empty. Below these sections are two large boxes for selecting organization units. The left box is labeled 'Data capture and maintenance organisation units' and contains a single entry: Kenya. The right box is labeled 'Data output and analysis organisation units' and also contains a single entry: Kenya. At the bottom of the interface are three buttons: 'Show more options', 'Add', and 'Cancel'.

The data capture and maintenance organisation units control for which organisation units the user can do data entry. You must assign at least one data capture and maintenance organisation unit to each user.

Users will have access to all sub-organisation units of the assigned organisation units. For example, if you've assigned a user to a district which has several facilities contained in the district, the user would have access to the district's data, as well as all of the facilities contained within the district.

#### 8. (Optional) Select **Data output and analysis organisation units**.

The data output and analysis organisation units controls for which organisation units the user can view aggregated data in the analytics apps, for example the **Pivot Table** and **GIS** apps. You can assign any number of data output and analysis organisation units to a user.

Users will have access to all sub-organisation units of the assigned organisation units. You shouldn't select the descendants of an organisation unit which you have already selected. For example, if you've assigned the user to a district, you shouldn't select the facilities within that district.

## Note

Assigning data output and analysis organisation units organisation units is optional. If you don't specify any organisation unit, the user will have access to the full organisation unit hierarchy for viewing aggregated data. As with the data capture organisation units, *you should not select descendant organisation units of a unit which you have already selected.*

In several places in the analytics apps, you can select "user organisation unit" for the organisation unit dimension. This mechanism will first attempt to use the data view organisation units linked to the current user. If not found, it will use the data capture and maintenance organisation units. If the user has been assigned to multiple organisation units, the use of "user organisation unit" may result in unpredictable behavior.

**9. Click **Show more options.****

<b>Available User Groups</b> <input type="text" value="Search.."/> User Group 1 User Group 2 User Group 3 User Group 4 User Group 5 User Group 6 User Group 7	<b>Selected User Groups</b> <input type="button" value="&gt;"/> <input type="button" value="&lt;"/> <input type="button" value="&gt;&gt;"/> <input type="button" value="&lt;&lt;"/>
<b>Available dimension restrictions for data analytics</b> <input type="text" value="Search.."/> Funding Agency Implementing Partner	<b>Selected dimension restrictions for data analytics</b> <input type="button" value="&gt;"/> <input type="button" value="&lt;"/> <input type="button" value="&gt;&gt;"/> <input type="button" value="&lt;&lt;"/>
<a href="#">Show less options</a> <input type="button" value="Add"/> <input type="button" value="Cancel"/>	

**10(Optional)** In the **Available user groups** section, double-click the user groups you want to assign to the user.

**11(Optional)** In the **Available dimension restrictions for data analytics** section, double-click the dimensions you want to assign to the user.

You can restrict the values the user sees in data analytics apps by selecting dimensions that will restrict the user's view.

**Example 16.3.**

Let's say you have defined *Implementing Partner* as a category option group set, and you have shared with this user only one or more specific implementing partners (category option groups). If you want to make sure that the user does not see totals in analytics that include values from other groups, assign *Implementing Partner* to the user. This insures that any data visible to the user through the analytics apps will be filtered to select only the Implementing Partner category option group(s) which are visible to the user.

**12Click **Add.****

### 16.3.2. Edit user objects

**1. Open the **Users** app and find the type of user object you want to edit.**

2. In the object list, click the relevant object and select **Edit**.
3. Modify the options you want.
4. Click **Save**.

### 16.3.3. Disable users

You can disable a user. This means that the user's account is not deleted, but the user can't log in or use DHIS2.

1. Open the **Users** app and click **User**.
2. In the list, click the relevant user and select **Disable**.
3. Click **OK** to confirm.

### 16.3.4. Display a user's profile

1. Open the **Users** app and click **User**.
2. In the list, click the relevant user and select **Profile**.

### 16.3.5. View users by organisation unit

You can view all users that have been assigned to a particular organisation unit.

1. Open the **Users** app and click **User by organisation unit**.
2. In the left-hand organisation unit tree, click an organisation unit.

A list of users which have been assigned to this organisation unit is displayed.

### 16.3.6. Assign search organisation units to users

1. Open the **Users** app and click **User**.
2. In the object list, click the relevant user and select **Assign search org units**.
3. Click the organisation units you want the user to be able to search in.
4. Click **Save**.

### 16.3.7. Delete current user

You can delete the user that is currently logged into the system.

1. Open the **Users** app and click **Delete current user**.
2. Enter your password and click **Delete**.

### 16.3.8. Clone users

1. Open the **Users** app and click **User**.
2. In the object list, click the relevant user and select **Replicate**.
3. Enter a new user name and password for the cloned user account.
4. Click **Replicate**.
5. In the object list, click the user you just created and click **Edit**.

6. Modify the options you want.

7. Click **Save**.

### 16.3.9. Change user password

The following rules apply when you create a new password:

- Password must contain at least one special character, that is any character other than alphabets and digit numbers.
- Password must contain at least one upper case character.
- Password must contain at least one digit number.
- Password can not contain user's user name or email address.
- Password can not contain generic words for example *system, admin, user, login, manager* etc.
- Password can not be one of the previous 24 passwords the user has used.

This doesn't apply in case a super user resets the password for another user.

- Password must contain more than minimum number of characters.

#### Note

You can configure the minimum number of characters: Open the **System Settings** app and click **Access > Minimum characters in password**.

- Password can not contain more than 40 characters

To change a user's password:

1. Open the **Users** app and click **User**.
2. In the object list, click the relevant user and select **Edit**.
3. Enter a new password and retype it.
4. Click **Save**.

### 16.3.10. Delete user objects

1. Open the **Users** app and find the type of user object you want to delete.
2. In the object list, click the relevant object and select **Remove**.
3. Click **OK** to confirm.

### 16.3.11. Display details of user objects

1. Open the **Users** app and find the type of user object you want to view.
2. In the object list, click the relevant object and select **Show details**.

## 16.4. Manage user roles

### 16.4.1. Create a user role

Create new user role

This object will be created with public edit and view rights

**Details**

Name \*

Description

Available	Selected
<input type="button" value="Filter"/> <input type="button" value="Filter"/> <input type="button" value="Clear"/> ART monthly summary Child Health Clinical Monitoring Checklist EPI Stock Facility Assessment HIV Pediatric monthly summary Inpatient Morbidity/Mortality Summary Life-Saving Commodities MNCH Quarterly Report Morbidity Mortality < 5 years PMTCT monthly summary Population	<input type="button" value="&gt;"/> <input type="button" value="&lt;"/> <input type="button" value="&gt;&gt;"/> <input type="button" value="&lt;&lt;"/>
<input type="button" value="Filter"/> <input type="button" value="Filter"/> <input type="button" value="Clear"/> ALL Accept data at lower levels Search Activity Plan Add/Update Program Indicator Add Tracked Entity Form Single Event Without Registration Data Entry Approve data Approve data at lower levels Archive data Add/Update Attribute Delete Attribute Delete Data Element Category Combo <small>Add/Update Data Element Category Combo</small>	<input type="button" value="&gt;"/> <input type="button" value="&lt;"/> <input type="button" value="&gt;&gt;"/> <input type="button" value="&lt;&lt;"/>

1. Open the **Users** app and click **User role**.
2. Click **Add new**.
3. Enter a **Name**, for example "Super user" or "Admin user".
4. Enter a **Description**.
5. In the **Data sets** section, double-click the data sets you want the user role to have access to.
6. In the **Programs** section, double-click the programs you want the user role to have access to.
7. **Authorities** section, double-click the authorities you want to give to the user role.
8. Click **Add**.

#### Tip

You can select multiple data sets, programs or authorities:

- One by one: press the Ctrl key and click the items one by one, then click the right arrow.
- In a series: press the Shift key and select the first and last item in the series, then click the right arrow.

### 16.4.2. Edit user objects

1. Open the **Users** app and find the type of user object you want to edit.
2. In the object list, click the relevant object and select **Edit**.
3. Modify the options you want.
4. Click **Save**.

### 16.4.3. Delete user objects

1. Open the **Users** app and find the type of user object you want to delete.
2. In the object list, click the relevant object and select **Remove**.
3. Click **OK** to confirm.

### 16.4.4. Display details of user objects

1. Open the **Users** app and find the type of user object you want to view.
2. In the object list, click the relevant object and select **Show details**.

### 16.4.5. Change sharing settings for user objects

1. Open the **Users** app and find the type of user object you want to modify.
2. In the object list, click the relevant object and select **Sharing settings**.
3. (Optional) Search for a user group and select it, then click the plus icon. The user group is added to the list.
4. (Optional) Select **External access (without login)**.
5. Change the settings for the user groups you want to modify.
  - **None**
  - **Can view**: Everyone in the user group can view the object
  - **Can edit and view**: Everyone in the user group can view and edit the object
6. Click **Save**.

## 16.5. Manage user groups

### 16.5.1. Create a user group

1. Open the **Users** app and click **User group**.
2. Click **Add new**.
3. In the **Name** field, type the name of the user group.
4. In the **Available users** section, double-click the users you want to add to the user group.
5. In the **Available user groups** section, double-click the user groups you want to add to the user group.
6. Click **Add**.

### 16.5.2. Join user groups

1. Open the **Users** app and click **User group**.
2. In the list, click the relevant user group and select **Join group**.

### 16.5.3. Leave user groups

1. Open the **Users** app and click **User group**.
2. In the list, click the relevant user group and select **Leave group**.

### 16.5.4. Edit user objects

1. Open the **Users** app and find the type of user object you want to edit.
2. In the object list, click the relevant object and select **Edit**.

3. Modify the options you want.
4. Click **Save**.

### 16.5.5. Delete user objects

1. Open the **Users** app and find the type of user object you want to delete.
2. In the object list, click the relevant object and select **Remove**.
3. Click **OK** to confirm.

### 16.5.6. Display details of user objects

1. Open the **Users** app and find the type of user object you want to view.
2. In the object list, click the relevant object and select **Show details**.

### 16.5.7. Change sharing settings for user objects

1. Open the **Users** app and find the type of user object you want to modify.
2. In the object list, click the relevant object and select **Sharing settings**.
3. (Optional) Search for a user group and select it, then click the plus icon. The user group is added to the list.
4. (Optional) Select **External access (without login)**.
5. Change the settings for the user groups you want to modify.
  - **None**
  - **Can view**: Everyone in the user group can view the object
  - **Can edit and view**: Everyone in the user group can view and edit the object
6. Click **Save**.

## 16.6. Enable support for OpenID

DHIS2 supports the OpenID standard, which allows third party login using a OpenID provider, for more information see <http://openid.net>. To create a custom OpenID URL for a user name you can visit this URL and log in with your OpenID provider: <http://openid-provider.appspot.com>.

To enable support for OpenID in DHIS2, you must:

1. **Set your OpenID provider**: This can be done inside system settings, under "Access". Here you can set both the OpenID provider, and also the label to display on the login page to login with this provider (defaults to Login with OpenID).
2. **Set the OpenID identifier on the user**: For every user that should be able to login with his OpenID identifier, you will need to set this on the user itself. This can be done in user management, under the email field, there is not a field called *OpenID* which can be used to fill in the OpenID identifier.

## 16.7. Decentralize user management

DHIS2 supports a concept for user management referred to as *managed users* which allows to explicitly define which users should be allowed to manage or modify which users. To "manage a user" implies that you can see and modify that user. The basic concept for user management is that you can see and modify users which you have been granted all of the authorities; in other words you can modify users which have a subset of your own authorities. The managed users concept gives you greater control over this.

The managed users concept allows you to define which users should be able to manage which users. This is configured through user groups and memberships within such groups. A user group can be configured to be allowed to manage other user groups from the standard add and update user interface. The effect is that a specific user can manage all users which are members of user groups which can be managed by a user group that the user is member of. In other words, users can be managed by all members of user groups which are managing user groups they are member of.

To enable this concept you should grant users the authority to "Add/update users within managed groups", and *not* grant access to the standard "Add/update users" authority. An implication of the managed users concept is that when creating a user with the "Add/update users within managed groups" only, the user must be made a member of at least one user group that the current user can manage. If not, the current user would lose access to the user being created immediately. This is validated by the system.

When granted the "Add/update users within managed groups" authority, the system lets a user add members to user groups for which she has read-only access to. The purpose of this is to allow for decentralized user management. You may define a range of user groups where other users may add or remove members, but not remove or change the name of the group.

## 16.8. Example: user management in a health system

In a health system, users are logically grouped with respect to the task they perform and the position they occupy.

1. Define which users should have the role as system administrators. They are often part of the national HIS division and should have full authority in the system.
2. Create roughly one user role for each position.

Examples of common positions are:

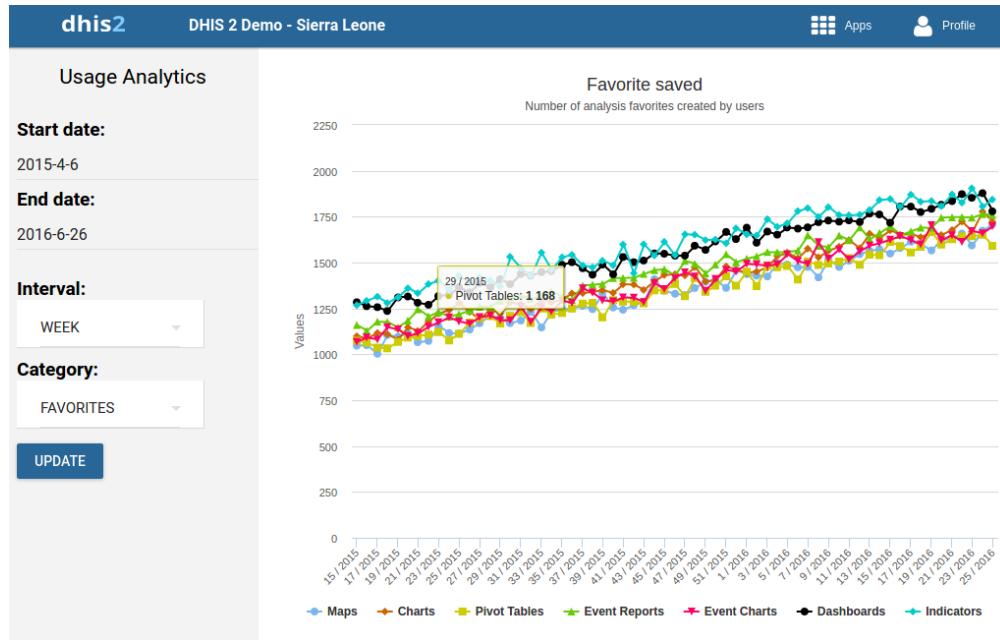

<b>Position</b>	<b>Typical tasks</b>	<b>Recommended authorities</b>	<b>Comment</b>
System administrators	Set up the basic structure (metadata) of the system.	Add, update and delete the core elements of the system, for example data elements, indicators and data sets.	Only system administrators should modify metadata.  If you allow users outside the system administrators team to modify the metadata, it might lead to problems with coordination.  Updates to the system should only be performed by the administrators of the system.
National health managers  Province health managers	Monitor and analyse data	Access to the reports module, the <b>GIS</b> , <b>Data Quality</b> apps and the dashboard.	Don't need access to enter data, modify data elements or data sets.

<b>Position</b>	<b>Typical tasks</b>	<b>Recommended authorities</b>	<b>Comment</b>
National health information system division officers (HISO)	Enter data that comes from facilities which are not able to do so directly	Access to all the analysis and validation apps	-
District health records and information officers (DHRIO)	Monitor, evaluate and analyse data	Access to the <b>Data Entry</b> app.	
Facility health records and information officers (HRIO)			
Data entry clerks	-	-	-

# Chapter 17. Visualize usage statistics

## 17.1. About the Usage Analytics app

The **Usage Analytics** app lets you visualize statistics on how users are working with the **Dashboard**, **Pivot Table**, **GIS**, **Event Visualizer**, **Data Visualizer** and **Event Reports** apps within DHIS2. With this statistics you can answers questions such as:

- How many times people have loaded charts, pivot tables and dashboards?
- How many favorites have users created?
- How many users that are logging in versus total number of users?
- What are the most viewed favorites?

## 17.2. Create a usage analytics graph

1. Open the **Usage Analytics** app.
2. Select a **Start date** and **End date**.
3. Select an **Interval**: day, week month or year.
4. Select a **Category**.

There are five analytics categories:

- **Favorite views**: Provides the number of times various types of favorites have been viewed, such as charts, pivot tables and dashboards, over time. This analysis lets you switch between all types of favorites, the total across all types and the average number of views.
- **Favorites**: Provides the number of favorites which have been created and stored in the system over time.
- **Users**: Provides the number of active as well as total number of users over time.
- **Top favorites**: Shows the most viewed favorites in the system by type.
- **Data values**: Provides the number of data values stored in the system over time.

5. Click **Update**.

# Chapter 18. Configure metadata

## 18.1. About the Maintenance app

In the **Maintenance** app you configure all the metadata objects you need to collect and analyze data:

- Categories
- Data elements
- Data sets and data entry forms
- Indicators
- Organisation units
- Program metadata: tracked entity, tracked entity attribute and relationship type
- Validation rules
- Attributes
- Constants
- Options sets
- Legends
- Predictors
- Push reports
- External map layers

### Note

The functions you have access to depend on your user role's access permissions.

## 18.2. Manage categories

### 18.2.1. About categories

Categories are typically a concept, for example "Gender", "Age" or "Disease Status". Data elements such as "Number of cases of confirmed malaria" are often broken into smaller component parts to determine, for example, the number of confirmed malaria cases of particular age groups.

Use categories to disaggregate data elements into individual components. You can also use categories to assign metadata attributes to all data recorded in a specific dataset, such as "Implementing partner" or "Funding agency."

#### Example 18.1. Three age categories

Create three categories: "Under 1", "1-5" and "Over 5". Assign them as categories to the data element. This creates three separate fields for this data in the data entry forms:

- Number of confirmed malaria cases (Under 1)
- Number of confirmed malaria cases (1-5)
- Number of confirmed malaria cases (Over 5)

Without categories, you would have had to create each of the data elements listed above separately.

In the **Maintenance** app, you manage the following and category objects:

**Table 18.1. Category objects in the Maintenance app**

<b>Object type</b>	<b>Available functions</b>
Category option	Create, edit, clone, share, delete, show details and translate
Category	Create, edit, clone, share, delete, show details and translate
Category combination	Create, edit, clone, share, delete, show details and translate
Category option combination	Edit and show details
Category option group	Create, edit, clone, share, delete, show details and translate
Category option group set	Create, edit, clone, share, delete, show details and translate

## 18.2.2. Workflow

1. Create all category options.
2. Create categories composed by the multiple category options you've created.
3. Create category combinations composed by either one or multiple categories.
4. Create data elements and assign them to a category combination.

## 18.2.3. Create or edit a category option

When possible, recycle category options. For instance, there might be two categories which might share a particular category option (for example <1 year of age). When creating the categories, this category option could be reused. This is important if particular category options (or category option combinations) that need to be analyzed together.

1. Open the **Maintenance** app and click **Category > Category option**.
2. Click the add button.
3. Fill in the form:
  - a. **Name**
  - b. **Short name**
  - c. **Start date**
  - d. **End date**
4. Select organisation units and assign them.

 **Tip**

You can automatically select all organisation units that belong to an organisation unit level or organisation unit group, for example "Chiefdom" or "Urban. To do this:

Select an **Organisation unit level** or **Organisation unit group** and click **Select**.

5. Click **Save**.

## 18.2.4. Create or edit a category

When you have created all category options for a particular category, you can create that category.

1. Open the **Maintenance** app and click **Category > Category**.
2. Click the add button.

3. Fill in the form:

- a. **Name**
- b. **Code**
- c. **Data dimension type**

A category either be of type "Disaggregation" or "Attribute". For disaggregation of data elements, you select **Disaggregation**. The data dimension type "Attribute" allows the category to be used to assign a combination of categories to data recorded through a data set.

- d. **Data dimension**

If you select **Data dimension**, the category will be available to the analytics as another dimension, in addition to the standard dimensions of "Period" and "Organisation unit".

4. Select category options and assign them.

5. Click **Save**.

## 18.2.5. Create or edit a category combination

Category combinations lets you combine multiple categories into a related set.

### Example 18.2. Category combination

You can disaggregate the data element "Number of new HIV infections" into the following categories:

- HIV Service: "Other", "PMTCT", "TB"
- Gender: "Male", "Female"

In this example, there are two levels of disaggregation that consist of two separate data element categories. Each data element category consist of several data element category options.

In DHIS2, different data elements are disaggregated according to a common set of categories. By combining these different categories into a category combination and assigning these combinations to data elements, you can apply the appropriate disaggregation levels quickly to a large number of data elements.

1. Open the **Maintenance** app and click **Category > Category combination**.

2. Click the add button.

3. Fill in the form:

- a. **Name**
- b. **Code**
- c. **Data dimension type**
- d. **Skip category total in reports**

4. Select categories and assign them.

5. Click **Save**.

## 18.2.6. Create or edit a category option group

You can group and classify category options by using category option groups. The main purpose of the category option group set is to add more dimensionality to your captured data for analysis in for example the **Pivot table** or **Data Visualizer** apps.

### Example 18.3. Category options groups and group sets

In a system, data is collected by "projects", where projects is modeled as category options. The system must be able to analyse data based on which donor that supports the project. In

In this case, create a category option group set called "Donor". Each donor can be created as a category option group, where each category option / project is put in the appropriate group. In the data analysis applications, the "Donor" group set will appear as a data dimension, while each donor appear as dimension items, ready to be included in reports.

To create a category option group:

1. Open the **Maintenance** app and click **Category > Category option group**.
2. Click the add button.
3. Fill in the form:
  - a. **Name**
  - b. **Short name**: Define a short name for the data element.
  - c. **Code**
  - d. **Data dimension type**
4. Select **Category options** and assign them.
5. Click **Save**.

### 18.2.7. Create or edit a category option group set

You can group category option groups in category option group sets. The main purpose of the category option group set is to add more dimensionality to your captured data for analysis in for example the **Pivot table** or **Data Visualizer** apps.

1. Open the **Maintenance** app and click **Category > Category option group set**.
2. Click the add button.
3. Fill in the form:
  - a. **Name**
  - b. **Description**
  - c. **Data dimension**
  - d. **Data dimension type**
4. Select **Category option groups** and assign them.
5. Click **Save**.

### 18.2.8. Use category combinations for data sets

When categories and category combinations have the data dimension type "Attribute", they can apply a common set of attributes to a related set of data values contained in a data set. When category combinations are used as a attribute, they serve as another dimension (similar to "Period" and "Organisation unit") which you can use in your analysis.

#### Example 18.4. Use category combination for a data set

Suppose that a NGO is providing ART services in a given facility. They would need to report each month on the "ART monthly summary", which would contain a number of data elements. The NGO and project could potentially change over time. In order to attribute data to a given NGO and project at any point in time, you need to record this information with each data value at the time of data entry.

1. Create two categories with the data dimension type "Attribute": "Implementing partner" and "Projects".
2. Create a category combination with the data dimension type "Attribute": "Implementing partners and projects".
3. Assign the categories you've created to the category combination.
4. Create a data set called "ART monthly summary" and select the "Implementing partners and projects" category combination.

When you enter data in the **Data entry** app, you can select an "Implementing partner" and a "Project". Each recorded data value, is assigned a specific combination of these categories as an attribute. These attributes (when specified as a dimension) can be used in the analysis applications similar to other dimensions, for example the period and organisation unit.

## 18.2.9. Assign a code to a category option combination

You can assign a code to category option combinations. This makes data exchange between DHIS2 and external systems easier. The system creates the category option combinations automatically.

1. Open the **Maintenance** app and click **Category > Category option combination**.
2. In the list, find the object you want to modify.
3. Click the options menu and select **Edit**.
4. Enter a code.
5. Click **Save**.

## 18.2.10. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

## 18.2.11. Change sharing settings for metadata objects

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and users groups that can view or edit a metadata object.

### Note

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.
2. In the object list, click the options menu and select **Sharing settings**.

3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.
4. Change sharing settings for the users and user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Close**.

### 18.2.12. Delete metadata objects

#### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

#### Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

### 18.2.13. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

### 18.2.14. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

#### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

#### Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.3. Manage data elements

### 18.3.1. About data elements

Data elements are the base of DHIS2. Data elements define what is actually recorded in the system, for example number of immunisations or number of cases of malaria.

Data elements such as "Number of cases of confirmed malaria" are often broken into smaller component parts to determine, for example, the number of confirmed malaria cases of particular age groups.

In the **Maintenance** app, you manage the following data elements objects:

**Table 18.2. Data element objects in the Maintenance app**

Object type	Available functions
Data element	Create, edit, clone, share, delete, show details and translate
Data element group	Create, edit, clone, share, delete, show details and translate
Data element group set	Create, edit, clone, share, delete, show details and translate

### 18.3.2. Workflow

1. Create all category options.
2. Create categories composed by the multiple category options you've created.
3. Create category combinations composed by either one or multiple categories.
4. Create data elements and assign them to a category combination.

### 18.3.3. Create or edit a data element

This object will be created with public edit and view rights

Name (\*)

Short name (\*)

Code

Description

Form name

Domain Type (\*)

Value type (\*)

Aggregation operator (\*)

Store zero data values

1. Open the **Maintenance** app and click **Data elements > Data element**.
2. Click the add button.
3. In the **Name** field, define the precise name of the data element.

Each data element must have a unique name.

4. In the **Short name** field, define a short name for the data element.

Typically, the short name is an abbreviation of the full data element name. This attribute is often used in reports to display the name of the data element, where space is limited.

5. (Optional) In the **Code** field, assign a code.

In many countries data elements are assigned a code.

6. In the **Description** field, type a description of the data element. Be as precise as possible and include complete information about how the data element is measured and what its purpose is.
7. In the **Form name** field, type an alternative name of the data element. This name can be used in either section or automatic data entry forms. The form name is applied automatically.
8. In the **Domain type** field, select whether the data element is an aggregate or tracker type of data element.
9. In the **Value type** field, select the type of data that the data element will record.

**Table 18.3. Value types**

<b>Value type</b>	<b>Description</b>
Age	-
Coordinate	A point coordinate specified as longitude and latitude in decimal degrees. All coordinate should be specified in the format "-19.23 , 56.42" with a comma separating the longitude and latitude.
Date	Dates rendered as calendar widget in data entry.
Date & time	-
Email	Email.
File	A file resource where you can store external files, for example documents and photos.
Integer	Any whole number (positive and negative), including zero.
Letter	A single letter.
Long text	Textual value. Renders as text area with no length constraint in forms.
Negative integer	Any whole number less than (but not including) zero.
Number	Any real numeric value with a single decimal point. Thousands separators and scientific notation is not supported.
Percentage	Whole numbers inclusive between 0 and 100.
Phone number	Phone number.
Positive integer	Any whole number greater than (but not including) zero.
Positive of zero integer	Any positive whole number, including zero.

Value type	Description
Organisation unit	Organisation units rendered as a hierarchy tree widget.
Unit interval	Any real number greater than or equal to 0 and less than or equal to 1.
Text	Textual value. The maximum number of allowed characters per value is 50,000.
Time	Time is stored in HH:mm format. HH is a number between 0 and 23 mm is a number between 00 and 59
Tracker associate	Tracked entity instance. Rendered as dialog with a list of tracked entity instances and a search field.
Username	DHIS 2 user. Rendered as a dialog with a list of users and a search field.
Yes/No	Boolean values, renders as drop-down lists in data entry.
Yes only	True values, renders as check-boxes in data entry.

10In the **Aggregation type** field, select the default aggregation operation that will be used on the data element.

Most data elements should have the **Sum** operator. This includes all data elements which should be added together. Other data elements, such as staffing levels, should be set to use the **Average** operator, when values along the time dimension should not be added together, but rather averaged.

**Table 18.4. Aggregation operators**

Aggregation operator	Description
Average	Average the values in both the period and the organisation unit dimensions.
Average (sum in organisation unit hierarchy)	Average of data values in the period dimension, sum in the organisation unit dimensions.
Count	Count of data values.
Min	Minimum of data values.
Max	Maximum of data values.
None	No aggregation is performed in any dimension.
Sum	Sum of data values in the period and organisation unit dimension.
Standard deviation	Standard deviation (population-based) of data values.
Variance	Variance (population-based) of data values.

11If you want to save zeros for a particular reason, select **Store zero data values**. By default, DHIS2 does not store zeros entered in the data entry module.

12In the **URL** field, enter a link to an in-depth description of the data element.

For example a link to a metadata repository or registry that contains detailed technical information about the definition and measurement of the data element.

13In the **Category combination** field, define which category combination the data element should have. This is also known as the "disaggregation".

14Select an **Option set**.

Option sets are predefined lists of options which can be used in data entry.

15Select an **Option set for comments**.

Option sets for comments are predefined lists of options which can be used to specify standardized comments for data values in data entry.

16Assign one or multiple **Legends**.

Legends are used in for example the **GIS** app to display certain data elements with certain icons.

17Set the **Aggregation levels** to allow the data element to be aggregated at one or more levels:

- In the left pane, select the levels you want to assign to the data element.
- Click the right arrow to assign the aggregation levels.

By default, the aggregation will start at the lowest assigned organisation unit. If you for example select "Chiefdom", it means that "Chiefdom", "District", and "National" aggregates use "Chiefdom" (the highest aggregation level available) as the data source, and PHU data will not be included. PHU data will still be available for the PHU level, but not included in aggregations to the levels above.

If you select both "District" and "Chiefdom", it means that the "District" and "National" level aggregates use District data as their source, "Chiefdom" will use Chiefdom, and "PHU" will use PHU.

18If applicable, enter custom attributes values, for example **Classification** or **Collection method**.

### Note

You create custom attributes in the **Maintenance** app: **Other > Attributes**.

19If applicable, select compulsory data element group sets, for example **Main data element group** or **Tracker-based data**.

### Note

You'll only see data element group sets in this form if you've created them and set them to **Compulsory**.

You create data element group sets in the **Maintenance** app: **Data element > Data element group set**.

20Click **Save**.

## 18.3.4. Create or edit a data element group

Data element groups lets you classify related data elements into a common theme. For example, two data elements "Measles immunisation" and "BCG Immunisation" might be grouped together into a data element group "Childhood immunisation".

To create a data element group:

1. Open the **Maintenance** app and click **Data elements > Data element group**.
2. Click the add button.
3. Fill in the form:
  - a. **Name**
  - b. **Short name**
  - c. **Code**
4. Select data elements and assign them.
5. Click **Save**.

### 18.3.5. Create or edit a data element group set

Data element group sets allows you to categorise multiple data element groups into a set. The system uses data element group sets during analysis and reporting to combine similar data element groups into a common theme. A data element group can be part of multiple data element group sets.

1. Open the **Maintenance** app and click **Data elements > Data element group set**.
2. Click the add button.
3. Fill in the form:
  - a. **Name**
  - b. **Code**
  - c. **Description**
  - d. **Compulsory**
  - e. **Data dimension**
4. Select data element groups and assign them.

Available data element groups are displayed in the left panel. Data element groups that are currently members of the data element group set are displayed in the right hand panel.

5. Click **Save**.

### 18.3.6. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

### 18.3.7. Change sharing settings for metadata objects

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and users groups that can view or edit a metadata object.

#### Note

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.

2. In the object list, click the options menu and select **Sharing settings**.
3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.
4. Change sharing settings for the users and user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Close**.

### 18.3.8. Delete metadata objects

#### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

#### Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

### 18.3.9. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

### 18.3.10. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

#### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

#### Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.

4. Type a **Name**, **Short name** and **Description**.

5. Click **Save**.

## 18.4. Manage data sets and data entry forms

### 18.4.1. About data sets and data entry forms

All data entry in DHIS2 is organised in data sets. A data set is a collection of data elements grouped together for data entry and data export between instances of DHIS2. To use a data set to collect data for a specific organisation unit, you must assign the organisation unit to the data set. Once you have assigned the data set to an organisation unit, that data set is available in the **Data entry** app. Only the organisation units that you have assigned the data set to can use the data set for data entry.

A category combination can link to both data elements and data sets. If you use a category combination for a data set, the category combinations is applicable for the whole form. This means that you can use categories to capture information which is common to an entire form, for example the name of the a project or grant. When a data set is linked to a category combination, those categories will be displayed as drop-down boxes in the **Data entry** app. Data captured in the form will then be linked to the selected category options from those drop-down boxes. For information about how to create categories and category combinations, see section "Manage data elements and categories". Make sure that you set the type of categories and category combinations to "Attribute".

#### Example 18.5. Categories for data sets

An scenario for when categories are useful is when you need to capture a data entry form for a implementing partner organisation and a project. In that case:

1. Create category options and categories for all partner organisations and projects and link them in a new category combination.
2. Assign the category combination to the data set (form) for which you need to capture this information.

When opening this data set in data entry module, the partner organisation and project categories will automatically be rendered as drop-down boxes, allowing you to select a specific implementing partner organisation and project before continuing to do data entry.

You create and edit data sets in the **Maintenance** app. Here you define, for example, which data elements you want to include in the data set and the data collection frequency.

You enter data in the **Data entry** app. The **Data entry** app uses data entry forms to display the data sets. There are three types of data entry forms:

**Table 18.5. Data entry form types**

Data entry form type	Description
Default form	<p>Once you have assigned a data set to an organisation unit, a default form is created automatically. The default form is then available in the <b>Data entry</b> app for the organisation units you have assigned it to.</p> <p>A default form consist of a list of the data elements belonging to the data set together with a column for inputting the values. If your data set contains data elements with a non-default category combination, for</p>

Data entry form type	Description
	<p>example age groups or gender, additional columns are automatically created in the default form based on the different categories.</p> <p>If you use more than one category combination you get multiple columns in the default form with different column headings for the options.</p>
Section form	<p>If the default form doesn't meet your needs, you can modify it to create a section form. Section forms give you more flexibility when it comes to using tabular forms.</p> <p>In a section form you can, for example, create multiple tables with subheadings and disable (grey out) cells in a table.</p> <p>When you have added a section form to a data set, the section form is available in the <b>Data entry</b> app.</p>
Custom form	<p>If the form you want to design is too complicated for default or section forms, you can create a custom form. A custom form takes more time to create than a section form, but you have full control over the design.</p> <p>You can, for example, mimic an existing paper aggregation form with a custom form. This makes data entry easier, and should reduce the number incorrectly entered data elements.</p> <p>When you have added a custom form to a data set, the custom form is available in the <b>Data entry</b> app.</p>

## A data set can have both section and custom forms

If a data set has both a section form and a custom form, the system displays the custom form during data entry. Users who enter data can't select which form they want to use. In web-based data entry the order of display preference is:

1. Custom form (if it exists)
2. Section form (if it exists)
3. Default form

Mobile devices do not support custom forms. In mobile-based data entry the order of display preference is:

1. Section form (if it exists)
2. Default form

In the **Maintenance** app, you manage the following data set objects:

**Table 18.6. Data set objects in the Maintenance app**

Object type	Available functions
Data set	<p>Create, assign to organisation units, edit, share, delete, show details and translate</p> <p>Edit compulsory data elements</p> <p>Add and remove multiple data sets to organisation units at once</p>

Object type	Available functions
Section form	Create, edit and manage grey fields
Section	Change display order, delete and translate
Custom form	Create, edit and script

## 18.4.2. Workflow

You need to have data elements and categories to create data sets and data entry forms.

1. Create a data set.
  2. Assign the data set to organisation units.
- A default form is created automatically.
3. Create a section form or a custom form.

Now you can register data in the **Data entry** app.

## 18.4.3. Create or edit a data set

The screenshot shows the DHIS2 Maintenance app interface. The top navigation bar has tabs for ALL, DATA ELEMENTS, DATA SET (which is highlighted in orange), INDICATORS, ORGANISATION UNITS, and OTHER. Below the navigation is a sidebar with a folder icon and the text 'Data Set'. The main content area is titled 'Data Set' and contains the following form fields:

- Name (\*)**: A text input field with a note: "This object will be created with public edit and view rights".
- Short name**: A text input field.
- Code**: A text input field.
- Description**: A text input field.
- Expiry days**: A text input field containing the value "0".
- Open future periods for data entry**: A text input field containing the value "0".

1. Open the **Maintenance** app and click **Data set > Data set**.
2. Click the add button.
3. In the **Name** field, type the precise name of the data set.
4. In the **Short name** field, define a short name for the data set.

Typically, the short name is an abbreviation of the full data set name. This attribute is often used to display the name of the data set where space is limited.

5. (Optional) In the **Code** field, assign a code.
6. In the **Description** field, type a description of the data set.
7. Enter the number of **Expiry days**.

The number of expiry days controls for how long it should be possible to enter data in the **Data entry** app for this data set. Expiry days refer to the number of days after the end date

of the selected data entry period where the data entry form should be open for entry. After the number of days has expired, the data set will be locked for further entry.

You can set manual exceptions to this using the lock exception functionality in the **Data Administration** app.

## Note

To allow data entry into all possible historical time periods, set the number of expiry days to zero.

8. If you want it to be possible to enter data for future periods, type the number of periods in the **Open future periods for data entry** field.

The value is the number of future periods which are available for data entry.

### Example 18.6. Open future periods for data entry

For a monthly data set a value of 2 allows you to enter data for 2 months in advance. This is useful for, by example, population, target and planning data.

9. In the **Days after period to qualify for timely submission** field, type the number of days in which data can be entered to be considered reported on time.

To verify the number of timely reports submitted, go to **Reports > Reporting rate summary**.

- 10Select a **Period type**.

The period type defines the frequency of reporting for the particular data set. The frequency can for example be daily, quarterly or yearly.

- 11Select a **Category combination** to assign it to the data set.

## Tip

Click **Add new** to create category combinations that you're missing. In the form that opens, create the category combinations you need. When you're done, click **Refresh values**.

- 12In the **Complete notification recipients** list, select a user group that should receive a message when the data set is marked as complete in the **Data Entry** app.

The message is delivered through the DHIS2 messaging system.

- 13If you want the user who entered the data to receive a message when the data set is marked as complete in the **Data entry** app, select **Send notification to completing user**.

The message is delivered through the DHIS2 messaging system.

- 14If applicable, select, a **Data approval workflow**.

- 15If you want it to be possible to use the data set within the Java mobile DHIS 2 application, select **Enable for Java mobile client**.

- 16If you want it to be mandatory to fill all values for a data element in data entry if one or more values have been filled, select **All fields for data elements required**.

This means that if you enter one data value for a data element in an entry field (that is for a category option combination), then you must enter data for all fields belonging to that data element (that is all category option combinations).

- 17If you want it to be possible to mark a data entry form as complete only if the validation of that form is successful, select **Complete allowed only if validation passes**.

If you select this option, you can't mark the form as complete if validation fails.

18If you want it to be mandatory that any missing values require a comment to justify their absence, select **Missing values requires comment on complete**.

19(Optional) Assign one or multiple **Legends**.

20If applicable, select **Skip offline**.

This option controls whether this data entry form should be downloaded and saved in the user's web browser. Normally you shouldn't select **Skip offline**. This is the default setting. If you have big forms which are rarely used you can consider selecting this option to speed up initial loading in the data entry module.

21If applicable, select **Data element decoration**

If you select this option, descriptions of data elements render in call-outs in downloaded data sets in offline mode in the **Data entry** app.

22If applicable, select **Render sections as tabs**.

This option is only applicable for section forms. The option allows you to render each section as a tab horizontally above the data set. This is useful for long data sets as it allows appropriate sections to be selected quickly without going through the entire form.

23If applicable, select **Render vertically**.

This option is only applicable for section forms.

24Select data elements and assign them.

You can override the category combination for each selected data set by clicking on the gear icon above the list of selected data elements. This allows you to utilize a specific category combination (disaggregation) within the current data set instead of the category combination associated directly with the data element itself.

25Select indicators and assign them.

26In the organisation unit tree, select the organisation units you want to assign the data set to.

### Tip

- Click **Organisation unit level** to select all organisation units that belong to a certain organisation level.
- Click **Organisation unit group** to select all organisation units that belong to a certain organisation unit group.

27Click **Save**.

You can now use the data set in the **Data Entry** app for the organisation units that you have assigned to and for periods according to the selected frequency (period type).

#### 18.4.4. Override data elements' category combinations in a data set

You can override which category combination to use for a data element within the context of a data set. This means that a data element can use different category combinations within different data sets. This is useful when you want to reuse a data element since you don't have to replicate the data element to allow multiple category combinations.

##### Example 18.7.

If different regions within your organisation unit hierarchy use different disaggregations, or if the disaggregations change over time, you can represent this by creating different data sets with the appropriate category combinations.

1. Open the **Maintenance** app and click **Data set > Data set**.

2. In the list, find the data set you want to modify.

3. Click the options menu and select **Edit**.
4. Go to the data elements section and click the spanner icon.
5. Select new category combinations and click **Close**.
6. Click **Save**.

#### 18.4.5. Edit compulsory data elements in a data set

You can add or remove data elements which will be marked as compulsory during data entry.

1. Open the **Maintenance** app and click **Data set > Data set**.
2. In the list, find the data set you want to edit.
3. Click the options menu and select **Edit compulsory data elements**.
4. Assign the compulsory data elements.
5. Click **Save**.

#### 18.4.6. Download default data forms in PDF format

You can download a default data from in PDF format for offline data entry.

1. Open the **Maintenance** app and click **Data set > Data set**.
2. In the list, find the object you want to download.
3. Click the options menu and select **Get PDF for data entry**.

#### 18.4.7. Manage section forms

##### 18.4.7.1. Create a section form

Section forms are separated automatically by data element category combinations, which produce a spreadsheet like data entry form for each section.

1. Open the **Maintenance** app and click **Data set > Data set**.
2. In the list, find the data set you want to create a section form for.
3. Click the options menu and select **Manage sections**.
4. Click the add button.
5. (Optional) In the **Name** field, type the name of the section.
6. (Optional) In the **Description** field, type a description of the section.
7. (Optional) To display totals for rows in the section form during data entry, select **Show row totals**.
8. (Optional) To display totals for columns in the section form during data entry, select **Show column totals**.
9. Assign data elements to the section:
  - a. (Optional) Select a **Category combination filter**.

##### Note

You can only use one category combination per section.

Option	Description
<b>None</b>	Displays all data elements that don't have a category combination.

Option	Description
<No filter>	Displays all data elements.

b. Select data elements and assign them.

10(Optional) Sort the data elements within the section by using the up and down arrows to the left of the assigned data elements field.

11Click **Save**.

12Repeat add section steps for each section you want to have in your section form.

In the **Data Entry** app you can now use the section form. The section form appears automatically when sections are available for the selected data set. Data sets which have section forms will automatically display the section form.

#### Example 18.8. Section form example

Note how each data element category has been separated into a separate section, and a data entry table has been automatically generated by the system. Use of section forms in combination with data element categories can drastically reduce the amount of time which is required to create data entry forms for data sets.

The image displays three separate data entry screens from a mobile application:

- PAC Services:** This section contains four data elements: Obstructed Labour, Sepsis, Manual Vacuum Aspiration, Dilation and Curettage, and Family planning uptake at PAC. A green edit icon is visible next to the first row. A header bar indicates "Amani Family Medical Clinic - January 2011" and "TB cases detected - (Children <14yrs, Female)".
- TB Control:** This section contains ten data elements: TB cases detected, Smear positive TB, Smear negative TB, Extra-Pulmonary TB patients, Re-treatment TB patients, TB patients tested for HIV, TB patients HIV+ve, TB HIV patient on CPT, TB Defaulters, TB patient completed treatment, and TB deaths. The table is organized into four columns: Children <14yrs (Female, Male) and Adult >14yrs (Female, Male). The "TB cases detected" row has a yellow edit icon.
- VCT:** This section contains three data elements: VCT clients counselled, VCT clients Tested, and VCT clients HIV+ve. The table is organized into four columns: 15-24yrs (Female, Male) and >25yrs (Female, Male).

#### 18.4.7.2. Edit a section form

1. Open the **Maintenance** app and click **Data set > Data set**.
2. In the list, find the data set you want to edit the section form for.
3. Click the options menu and select **Manage sections**.
4. In the list, find the section you want to edit.
5. Click the options menu and select **Edit**.
6. Edit the section and click **Save**.
7. Repeat edit section steps for each section you want to edit.

### 18.4.7.3. Manage grey fields in a section form

You can disable data elements and category options for data entry. That means it won't be possible to enter data into these fields during data entry.

Data element	Fixed		Outreach	
	<1y	>1y	<1y	>1y
OPV1 doses given	<input checked="" type="checkbox"/> Enabled			
BCG doses given	<input checked="" type="checkbox"/> Enabled			
Fully Immunized child	<input checked="" type="checkbox"/> Enabled			
OPV3 doses given	<input checked="" type="checkbox"/> Enabled			
OPV0 doses given	<input checked="" type="checkbox"/> Enabled			
PCV2 doses given	<input checked="" type="checkbox"/> Enabled			
Penta3 doses given	<input checked="" type="checkbox"/> Enabled			
Yellow Fever doses given	<input checked="" type="checkbox"/> Enabled			
PCV3 doses given	<input checked="" type="checkbox"/> Enabled			
PCV1 doses given	<input checked="" type="checkbox"/> Enabled			
LLITN given at Penta3	<input checked="" type="checkbox"/> Enabled			
Measles doses given	<input checked="" type="checkbox"/> Enabled			
OPV2 doses given	<input checked="" type="checkbox"/> Enabled			
Penta1 doses given	<input checked="" type="checkbox"/> Enabled			
Penta2 doses given	<input checked="" type="checkbox"/> Enabled			

CANCEL SAVE

1. Open the **Maintenance** app and click **Data set > Data set**.
2. In the list, find the data set you want to edit the section form for.
3. Click the options menu and select **Manage sections**.
4. In the list, find the section you want to edit.
5. Click the options menu and select **Manage grey fields**.
6. Select which fields you want to disable.

#### Note

If you've sections that contain data elements assigned to multiple category combinations, switch between the category combinations to view all fields.

7. Click **Save**.

### 18.4.7.4. Change section display order in a section form

You can control in which order sections are displayed in a section form.

1. Open the **Maintenance** app and click **Data set > Data set**.
2. In the list, find the data set you want to edit the section form for.
3. Click the options menu and select **Manage sections**.
4. In the list, find the section you want to move.
5. Click the options menu and select **Move up** or **Move down**.

If the section you want to move is the first or last section in the list, you'll only see one of the move options.

### 18.4.7.5. Delete a section in a section form

1. Open the **Maintenance** app and click **Data set > Data set**.
2. In the list, find the data set you want to edit the section form for.
3. Click the options menu and select **Manage sections**.
4. In the list, find the section you want to delete.
5. Click the options menu and select **Delete**.

### 18.4.7.6. Translate a section in a section form

1. Open the **Maintenance** app and click **Data set > Data set**.
2. In the list, find the data set you want to edit the section form for.
3. Click the options menu and select **Translate**.
4. Select a locale.
5. Enter the required information.
6. Click **Close**.

## 18.4.8. Manage custom forms

### 18.4.8.1. Create a custom form

You design custom forms in a built-in WYSIWYG HTML editor. If you select **Source**, you can paste HTML code directly in the editing area. For a complete guide on how to use the editor, refer to <http://docs.ckeditor.com/>.

The screenshot shows the dhis2 Maintenance app interface for creating a custom data entry form. The main window displays the 'ART monthly summary data entry form' under the 'DATA SET' tab. The form consists of a table with columns for gender (MALE, FEMALE) and age groups (<15, 15-24, 25-49, >49). Rows represent clinical indicators such as STAGING, DIAGNOSTIC TESTING, ENROLLMENT, and ENTRY POINTS. Each row contains multiple input fields, each preceded by an 'ART entr.' label. To the right of the main form, there is a sidebar titled 'Filter elements' which lists 284 data elements related to ART clients, including various demographic and clinical filters. At the bottom of the main form, there are buttons for 'SAVE', 'CANCEL', and 'DELETE'.

To create a custom form:

1. Open the **Maintenance** app and click **Data set**.
2. In the list, find the data set you want to add a custom form to.
3. Click the options menu and select **Design data entry form**.
4. In the editing area, create the custom form.
  - Double-click on an object in the left-hand list to insert it in the form.
  - If you already have the HTML code for your form, click **Source** and paste the code.

**5. Select a Form display style.**

**6. Click Save.**

### 18.4.8.2. Scripting in custom forms

In custom data entry form you can use JavaScript to create dynamic behavior and customizations. As an example, you can hide form sections based on specific user input for data elements, or show specific information when a form loads.

#### 18.4.8.2.1. Events

The DHIS2 data entry module provides a range of events which you can register for and use to perform actions at certain times. The events are registered on the document element. The jQuery event object and the data set identifier are always the first two arguments provided to the callback functions. The table below provides an overview of the events and when they are triggered.

**Table 18.7. Data entry events**

Key	Description	Arguments
dhis2.de.event.formLoaded	Triggered after the data entry form is rendered, but before data values are set in entry fields.	Event   Data set ID
dhis2.de.event.dataValuesLoaded	Triggered after data values are set in entry fields.	Event   Data set ID
dhis2.de.event.formReady	Triggered when the data entry form is completely rendered and loaded with all elements.	Event   Data set ID
dhis2.de.event.dataValueSaved	Triggered when a data value is saved successfully.	Event   Data set ID   Data value object
dhis2.de.event.completed	Triggered when a data set is successfully marked as complete.	Event   Data set ID   Complete registration object
dhis2.de.event.uncompleted	Triggered when a data set is successfully marked as incomplete.	Event   Data set ID
dhis2.de.event.validationSuccess	Triggered when validation is done and there were no violations.	Event   Data set ID
dhis2.de.event.validationError	Triggered when validation is done and there were one or more violations.	Event   Data set ID
dhis2.ou.event.orgUnitSelected	Triggered when one or more organisation units are selected in the org unit web tree.	Event   Org unit IDs   Org unit names   Sub org unit IDs

To register for an event:

```
<script type="text/javascript">

dhis2.util.on( 'dhis2.de.event.formReady', function( event, ds ) {
    console.log( 'The form with id: ' + ds + ' is loaded!' );
} );

dhis2.util.on( 'dhis2.de.event.dataValueSaved', function( event, ds, dv ) {
    console.log( 'Data value: ' + dv.value + ' was saved with data element: ' + dv.de );
} );

```

```
dhis2.util.on( 'dhis2.de.event.completed', function( event, ds, cr ) {
    console.log( 'Form was completed for org unit: ' + cr.ou );
} );

</script>
```

## Note

Be careful to only use "namespaced" events like the ones in the example above and not general ones like "click" as the dhis2.util.on method will unregister the event first.

If your function only applies to certain data sets you can use the supplied data set identifier and shortcut your function for unwanted data sets like this:

```
dhis2.de.on( 'dhis2.de.event.validationSuccess', function( event, ds ) {
    if ( $.inArray( ds, ['utXOiGbEj14', 'Re7qzHEThSC'] ) == -1 ) {
        return false;
    }
    console.log( 'Form with id: ' + ds + ' validated successfully!' );
} );
```

The identifiers of the input fields in the data entry form is on the format described below. This format can be used to select the input fields in your script and perform actions on them:

```
<dataelementid>-<optioncomboid>-val
```

Since the data set identifier is provided for all events a feasible alternative is to utilize the "files" Web API resource and keep your callback functions in a single file, where you let the JavaScript code take action based on which data set is currently loaded.

### 18.4.8.2.2. Functions

The DHIS2 data entry module contains JavaScript API functions which can be accessed from custom data entry forms.

**dhis2.de.api.getSelections:** This function returns a JavaScript object which contains properties for all dimensions with corresponding values for the identifiers of the selected options. It contains properties for "ds" (data set), "pe" (period), "ou" (organisation unit) and identifiers for all data set categories.

An example response looks like this:

```
{
+  ds: "lyLU2wR22tC",
+  pe: "201605",
+  ou: "g8upMTyEZGZ",
+  LFsZ8v5v7rq: "CW81uF03hvV",
+  yY2bQYqNt0o: "yMj2MnmNI8L"
+}
```

Example JavaScript usage of this function:

```
var sel = dhis2.de.api.getSelections();
+var orgUnit = sel["ou"];
+var partner = sel["LFsZ8v5v7rq"];
```

### 18.4.9. Change sharing settings for metadata objects

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and users groups that can view or edit a metadata object.

## Note

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.
2. In the object list, click the options menu and select **Sharing settings**.
3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.
4. Change sharing settings for the users and user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Close**.

### 18.4.10. Delete metadata objects

## Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

## Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

### 18.4.11. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

### 18.4.12. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

## Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

## Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.5. Manage indicators

### 18.5.1. About indicators

An indicator is a formula that can consist of multiple data elements, constants, organisation unit group counts and mathematical operators. The indicator consist typically of a numerator and denominator. You use indicators to calculate coverage rates, incidence and other values that are a result of data element values that have been entered into the system. Calculated totals do not have a denominator.

## Note

You never enter indicators directly in DHIS2, you calculate them.

An indicator formula can consist of mathematical operators, for example plus and minus, and of the following elements:

**Table 18.8. Indicator formula**

Formula element	Type	Description
Constant	Component	<p>Constants are numerical values which remain the same for all indicator calculations. This is useful in order to have a single place to change values that might change over time.</p> <p>Constants are applied AFTER data element values have been aggregated.</p>
Data elements	Component	<p>Data elements are substituted by the data value captured for the data element.</p>
Days	Operator	<p>"Days" is special operator that always provides the number of days for a given indicator calculation.</p> <p>For example: if you want to calculate the "Percentage of time vaccine refrigerator was non-functional", you could define the numerator as:</p>

Formula element	Type	Description
		<p>("Days"-Number of days vaccine refrigerator was available")/Days</p> <p>If the fridge was available 25 days in June, the indicator would be calculated as:</p> $(30-25/25)*100 = 17 \%$ <p>If you want to calculate the total for Quarter 1, the number of days ("Days") would be:</p> $31+28+31 = 90$ <p>The "Days" parameter will always be the number of days in the period of interest.</p>
Organisation unit counts	Component	<p>You can use organisation unit groups in formulas. They will be replaced by the number of organisation units in the group. During aggregation, the organisation units in the group will be intersected with the part of the organisation unit hierarchy being requested.</p> <p>This lets you use the number of public facilities in a specific district in indicators. This is useful for example when you create facility infrastructure surveys and reports.</p>
Programs	Component	<p>Click <b>Programs</b> and select a program to view all data elements, attributes and indicators related to a specific program.</p> <p>The program components you include in your formula will have a program tag assigned to them.</p>

In the **Maintenance** app, you manage the following indicator objects:

**Table 18.9. Indicator objects in the Maintenance app**

Object type	Available functions
Indicator	Create, edit, clone, share, delete, show details and translate

Object type	Available functions
Indicator type	Create, edit, clone, delete, show details and translate
Indicator group	Create, edit, clone, share, delete, show details and translate
Indicator group set	Create, edit, clone, share, delete, show details and translate

## 18.5.2. Workflow

1. Create indicator types.
2. Create indicators.
3. Create indicator groups.
4. Create indicator group sets.

## 18.5.3. Create or edit an indicator type

The screenshot shows the DHIS2 web application interface. The top navigation bar includes the logo 'dhis2', the title 'DHIS 2 Demo - Sierra Leone', a search bar labeled 'Search apps', and a user icon labeled 'JT'. Below the navigation is a horizontal menu with tabs: ALL, DATA ELEMENTS, DATA SET, INDICATORS (which is underlined in orange), ORGANISATION UNITS, and OTHER. On the left, there is a sidebar with a tree structure: 'Indicator' is expanded, showing 'Indicator Type' (which is selected and highlighted in blue), 'Indicator Group', and 'Indicator Group Set'. The main content area is titled 'Indicator Type' and contains two input fields: 'Name (\*)' and 'Factor (\*')'. At the bottom are two buttons: a large orange 'SAVE' button and a smaller 'CANCEL' button.

Indicator types define a factor that is applied during aggregation. Indicator values that are calculated during a data mart export or report table generation process will appear properly formatted, and will therefore not require an additional multiplier (for example 100 in the case of percents) for the values to appear correctly formatted.

### Note

As of version 2.4 of DHIS2, the "Calculated data element" object has been deprecated. Instead, you can create a calculated data element by creating an indicator type with a factor of "1" and by setting the "Number" option to "Yes". The effect of setting the "Number" option to "Yes" will be that the indicator will effectively not have a denominator. You will therefore only be able to define a numerator, which will serve as the formula of the calculated data element.

1. Open the **Maintenance** app and click **Indicator > Indicator type**.
2. Click the add button.
3. In the **Name** field, type the name of the indicator type, for example "Per cent", "Per thousand", "Per ten thousand".
4. Type a **Factor**.

The factor is the numeric factor that will be multiplied by the indicator formula during the calculation of the indicator.

5. Click **Save**.

#### 18.5.4. Create or edit an indicator

The screenshot shows the DHIS2 web interface for creating an indicator. The top navigation bar includes links for ALL, CATEGORY, DATA ELEMENT, DATA SET, INDICATOR (which is highlighted), ORGANISATION UNIT, PROGRAM, VALIDATION, OTHER, and a search bar labeled 'Search apps'. On the left, a sidebar under 'Indicator' contains links for Indicator type, Indicator group, and Indicator group set. The main form area has the following fields:

- Name (\*)**: ANC 2 Coverage
- Short name (\*)**: ANC 2 Coverage
- Code**: IN\_52491
- Description**: Total 2nd ANC visits (Fixed and outreach) by expected number of pregnant women.
- Annualized**: A checked checkbox.
- Decimals in data output**: A dropdown menu.
- Indicator type (\*)**: Per cent
- Legends**: A section containing a list of indicators and two buttons: 'ASSIGN ALL 20 →' and '← REMOVE ALL 1'.
- URL**: An empty field.
- Category option combination for aggregate data export**: An empty field.
- Attribute option combination for aggregate data export**: An empty field.

1. Open the **Maintenance** app and click **Indicator > Indicator**.
2. Click the add button.
3. In the **Name** field, type the full name of the indicator, for example "Incidence of confirmed malaria cases per 1000 population".
4. In the **Short name** field, type an abbreviated name of the indicator, for example "Inc conf malaria per 1000 pop".

The short name must be less than or equal to 25 characters, including spaces.

5. (Optional) In the **Code** field, assign a code.

In many countries indicators are assigned a code.

6. In the **Description** field, type a brief, informative description of the indicator and how it is calculated.
7. If you want to apply an annualization factor during the calculation of the indicator, select **Annualized**.

Typically, an annualized indicator's numerator is multiplied by a factor of 12, and the denominator is for instance a yearly population figure. This allows for monthly coverage values to be calculated with yearly population figures.

8. Select the number of **Decimals in data output**.

9. Select an **Indicator type**.

This field determines a factor that will automatically be applied during the calculation of the indicator. Possible choices are determined by the indicator types. For example, a "Percent" indicator will automatically be multiplied by a factor of 100 when exported to the data mart, so that it will display as a percentage.

10(Optional) Assign one or multiple **Legends**.

11In the **URL** field, enter a link, for example a link to an indicator registry, where a full metadata description of the indicator can be made available.

12(Optional) Enter a **Category option combination for aggregate data export..**

You use this setting to map aggregated data exported as raw data to another server. Typically you do this type of data exchange mapping when you want to create anonymous aggregated data from patient data recorded in programs (event data).

13(Optional) Enter an **Attribute option combination for aggregate data export..**

You use this setting to map aggregated data exported as raw data to another server. Typically you do this type of data exchange mapping when you want to create anonymous aggregated data from patient data recorded in programs (event data).

14If applicable, enter custom attributes values, for example **Classification** or **Collection method**.

## Note

You create custom attributes in the **Maintenance** app: **Other > Attributes**.

15Click **Edit numerator**.

- a. Type a clear description of the numerator.
- b. Define the numerator by double-clicking components in the right-hand field. The components then appears as part of the formula in the left-hand field. Add mathematical operators by double-clicking the icons below the left-hand field.

You formula must be mathematically valid. This includes correct use of parentheses when necessary.

- c. Click **Done** to save all changes to the numerator.

16Click **Edit denominator**.

- a. Type a clear description of the denominator.
- b. Define the denominator by double-clicking components in the right-hand field. The components then appears as part of the formula in the left-hand field. Add mathematical operators by double-clicking the icons below the left-hand field.

You formula must be mathematically valid. This includes correct use of parentheses when necessary.

- c. Click **Done** to save all changes to the denominator.

17If applicable, select compulsory indicator group sets, for example **Human resources**.

## Note

You'll only see indicator group sets in this form if you've created them and set them to **Compulsory**.

You create indicator group sets in the **Maintenance** app: **Indicator > Indicator group set**.

18Click **Save**.

## 18.5.5. Create or edit an indicator group

1. Open the **Maintenance** app and click **Indicator > Indicator group**.
2. Click the add button.
3. Type a name.
4. Select indicators and assign them.
5. Click **Save**.

## 18.5.6. Create or edit an indicator group set

Indicator group sets create combined groups of similar indicators. For example, you might have a group of indicators called "Malaria" and "Leishmaniasis". Both of these groups could be combined into a group set called "Vector-borne diseases". Indicator groups sets are used during analysis of data to combine similar themes of indicators.

1. Open the **Maintenance** app and click **Indicators > Indicator group**.

2. Click the add button.

3. Fill in the form:

a. **Name**

b. **Description**

c. **Compulsory**

4. Select indicator groups and assign them.

Available indicator groups are displayed in the left panel. Indicator groups that are currently members of the indicator group set are displayed in the right hand panel.

5. Click **Save**.

### 18.5.7. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.

2. In the object list, click the options menu and select **Clone**.

3. Modify the options you want.

4. Click **Save**.

### 18.5.8. Change sharing settings for metadata objects

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and users groups that can view or edit a metadata object.

#### Note

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.

2. In the object list, click the options menu and select **Sharing settings**.

3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.

4. Change sharing settings for the users and user groups you want to modify.

- **Can edit and view:** Everyone can view and edit the object.

- **Can view only:** Everyone can view the object.

- **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.

5. Click **Close**.

### 18.5.9. Delete metadata objects

#### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

## Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

### 18.5.10. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

### 18.5.11. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

#### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

#### Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.6. Manage organisation units

In this section you will learn how to:

- Create a new organisation unit and build up the organisation unit hierarchy
- Create organisation unit groups, group sets, and assign organisation units to them
- Modify the organisation unit hierarchy

### 18.6.1. About organisation units

The organisation unit hierarchy defines the organisation structure of DHIS2, for example how health facilities, administrative areas and other geographical areas are arranged with respect to each other. It is the "where" dimension of DHIS2, similar to how periods represent the "when" dimension.

The organisation unit hierarchy is built up by parent-child relations. In DHIS2, each of these nodes is an organisation unit. A country might for example have eight provinces, and each province might have a number of districts as children. Normally, the lowest levels consist of facilities where data is collected. Data collecting facilities can also be located at higher levels, for example national or provincial hospitals. Therefore, you can create skewed organisation trees in DHIS2.

- You can only have one organisation hierarchy at the same time.
- You can have any number of levels in a hierarchy.

Typically national organisation hierarchies in public health have four to six levels.

- You can create additional classifications by using organisation groups and organisation group sets.

For example to create parallel administrative boundaries to the health care sector.

- It is recommended to use organisation unit groups to create a non-geographical hierarchy.
- An organisation unit can only be a member of a single organisation unit group within an organisation unit group set.
- An organisation unit group can be part of multiple organisation unit group sets.
- The organisation unit hierarchy is the main vehicle for data aggregation on the geographical dimension.
- When you close an organisation unit, you can't register or edit events to this organisation unit in the **Event Capture** and **Tracker Capture** apps.

## **Changing the organisation unit hierarchy**

You can change the organisation unit hierarchy after you've created it, even organisation units that collect data. However, DHIS2 always uses the latest hierarchy for data aggregation. So if you change the hierarchy, you lose the temporal representation of the hierarchy across time.

### **Example 18.9.**

District A is sub-divided into District B and District C. Facilities which belonged to District A are reassigned to District B and C. Any historical data, which you entered before the split occurred, is still registered as belonging to District B and C, not to the obsolete District A.

In the **Maintenance** app, you manage the following organisation unit objects:

**Table 18.10. Organisation unit objects in the Maintenance app**

Object type	Available functions
Organisation unit	Create, edit, clone, delete, show details and translate
Organisation unit group	Create, edit, clone, share, delete, show details and translate
Organisation unit group set	Create, edit, clone, share, delete, show details and translate
Organisation unit level	Edit and translate
Hierarchy operations	Move organisation units

### **18.6.2. Workflow**

The recommended workflow is:

1. Create organisation units.
2. Create organisation unit groups.
3. Create organisation unit group sets.

### 18.6.3. Create or edit an organisation unit

The screenshot shows the DHIS2 Maintenance app interface. The top navigation bar includes tabs for ALL, CATEGORY, DATA ELEMENT, DATA SET, INDICATOR, ORGANISATION UNIT (which is highlighted in blue), PROGRAM, VALIDATION, and OTHER. Below the navigation is a search bar labeled 'Search apps'. On the far right, there are icons for 'TW' and a gear. The main content area features a sidebar on the left with a tree view under 'Organisation unit', listing 'Organisation unit group', 'Organisation unit group set', 'Organisation unit level', and 'Hierarchy operations'. The main panel displays a form for creating a new organisation unit. The form fields include 'Parent organisation unit' (set to 'Badjia'), 'Name (\*)' (set to 'Ngeluhun CHC'), 'Short name (\*)' (set to 'Ngeluhun CHC'), 'Code' (set to 'OU\_559'), 'Description' (empty), 'Opening date (\*)' (set to '1970-01-01'), and 'Closed date' (empty).

You add organisation units to the hierarchy one by one, either as a root unit or as a child of a selected organisation unit. You can only have one root unit.

1. Open the **Maintenance** app and click **Organisation unit > Organisation unit**.
2. Click the add button.
3. Select which organisation unit your new organisation unit will belong to:
  - a. Click **Parent organisation unit**.
  - b. In the organisation unit tree, locate the parent organisation unit and select it. Your selection is marked in yellow.

#### Tip

Click the arrows to expand the organisation unit tree.

- c. Click **Select**.
4. Enter a **Name** of the organisation unit.

Each organisation unit must have an unique name.

5. Enter a **Short name** for the organisation unit.

Typically, the short name is an abbreviation of the full organisation unit name. This attribute is often used in reports to display the name of the organisation unit, where space is limited.

6. (Optional) Assign a **Code**.

In many countries organisation units are assigned a code.

7. (Optional) Type a **Description** of the organisation unit.

8. Select an **Opening date**.

The opening dates control which organisation units that existed at a point in time, for example when analysing historical data.

9. If applicable, select a **Closed date**.

10In the **Comment** field, enter any additional information that you would like to add.

11(Optional) In the **URL** field, enter a link to an external web site that has additional information about the organisation unit.

12Enter contact information:

- Contact person
- Address
- E-mail
- Phone number

13(Optional) Enter **Latitude** and **Longitude**.

You must have latitude and longitude values to create maps in the **GIS** app. Then your organisation units can be represented as points on a map, for example a health facility. Without this information, the **GIS** app will not work.

It might be more efficient to import coordinates later as a batch job for all organisation units using the **Import-Export** app. You also use the **Import-Export** app to create polygons. A polygon is an organisation unit that represent an administrative boundary.

14If applicable, select **Data sets** and assign them.

### Note

You control whether a user should be able to assign data sets to an organisation unit in the **System Settings** app:

Open the **System Settings** app, click **Access** and select **Allow assigning object to related objects during add or update**.

15If applicable, enter custom attributes values, for example **HR identifier**.

### Note

You configure the custom attributes in the **Maintenance** app:

Open the **Maintenance** app and click **Other > Attribute**.

16Click **Save**.

## 18.6.4. Create or edit an organisation unit group

Organisation unit groups allow you to classify related organisation units into a common theme. You can for example group all organisation units that are hospitals in an **Hospital** group.

1. Open the **Maintenance** app and click **Organisation unit > Organisation unit group**.

2. Click the add button.

3. Fill in the form:

- a. **Name**: Provide a precise, unique and descriptive name for the organisation unit group.
- b. **Short name**: The short name should be less than 25 characters. Typically, the short name is an abbreviation of the full organisation unit name. This attribute is used in certain places in DHIS2 where space is limited.
- c. **Code**
- d. **Symbol**: Select a symbol which will be used to display the organisation unit (points only) when the layer is displayed in the **GIS** app.

4. In the organisation tree, click the organisation units you want to add to the organisation unit group.

You can locate an organisation unit in the tree by expanding the branches (click on the arrow symbol), or by searching for it by name.

The selected organisation units display in orange.

5. Click **Save**.

## 18.6.5. Create or edit an organisation unit group set

Organisation unit group sets allows you to create additional classifications of organisation units. The group sets create new dimensions so that you can make a more detailed data analysis. You can easily filter, organise or aggregate data by groups within a group set.

- You can have any number of organisation unit group sets.
- The default organisation unit group sets are **Type** and **Ownership**.
- An organisation unit can only be a member of a single organisation unit group within an organisation unit group set.
- An organisation unit group can be part of multiple organisation unit group sets.
- You can define whether an organisation unit group set is compulsory or not, which will affect the completeness of the data. Compulsory means that all organisation units must be members of a group in that group set.

## Data completeness

In the **Data integrity** part of the **Data administration** app you can verify if you've accidentally assigned the same organisation unit to multiple groups within the same group set. In this app you also find information about organisation units that are not members of a compulsory organisation unit group set.

1. Open the **Maintenance** app and click **Organisation unit > Organisation unit group set**.
2. Click the add button.
3. Fill in:
  - a. **Name:** Provide a precise name for the organisation unit group set.
  - b. **Code**
  - c. **Description:** Describe what the organisation unit group set measures or captures.
4. If you want all organisation units to be members of a group within the group set, select **Compulsory**.
5. (Optional) Select **Data dimension**.
6. (Optional) Select **Include subhierarchy in analytics**.

If you select this, a sub-organisation unit will inherit the organisation unit group property from its closest "parent" organisation unit. Any property on the sub-organisation unit will override the inherit value.

If an organisation unit has no associated organisation unit group, the organisation unit can inherit its closest parent's organisation unit group. If none of the parent organisation unit groups have an organisation unit group for a given org unit group set, the result will still be "blank", but if at least one parent has an organisation unit group, sub-organisation unit will inherit it.

"include subhierarchy in analytics" is enabled, which means the org units inherit their closest parents org unit group IF the org unit is white (no org unit group associated with it).

7. Select organisation unit groups and assign them.

In the left-hand list, you find the available organisation unit groups. Use the arrows to move selected groups between the two lists.

If there are no organisation unit groups in the left-hand list, click **Add new**. In the form that opens, create the organisation units group you need. When you're done, click **Refresh values**.

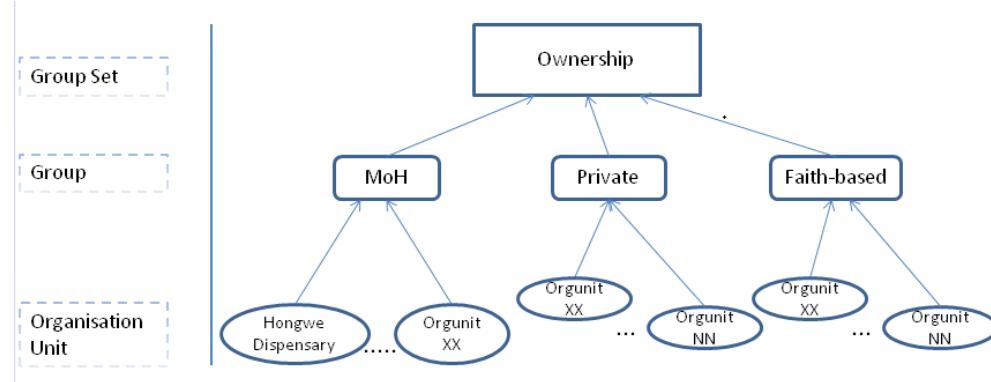

## Note

An organisation unit can only be a member of a single organisation unit group within an organisation unit group set.

8. Click **Save**.

### Example 18.10. Classify facilities based on ownership

You want to analyse data based on the ownership of the facilities. All facilities have an owner so you need to make sure that all organisation units get this classification. To do that you can use the **Compulsory** option:

1. Create a group for each ownership type, for example "MoH", "Private" and "Faith-based".
2. Assign all facilities in the database to one of these groups.
3. Create an organisation unit group set called "Ownership" and select **Compulsory**.
4. Assign the organisation unit groups "MoH", "Private" and "Faith-based" to the "Ownership" organisation group set.

### Example 18.11. Create parallel dynamic administrative organisation unit structure

DHIS 2 Pivot Tables

\* ANC: ANC by area last 12 months

Group your organisation unit in two ways and aggregate data on these two parallel hierarchies

Use to aggregate data (only in analytics apps)

An additional setting to the organisation unit group set, creates a dynamic "membership" to a organisation unit group set.

You don't change the organisation unit hierarchy

Scalable and dynamic

Dynamic inclusion of hierarchy

Dynamic additional classification

## 18.6.6. Assign names to organisation unit levels

When you add children to an organisation unit, DHIS2 automatically creates a new organisation unit level if necessary. The system also assigns a generic name to this level, for example "Level 5". You can replace the generic name with a contextual name, for example "Country", "Province", "District" or "Health Facility". DHIS2 uses the contextual names anywhere levels are referred to, for example in the **GIS** app.

1. Open the **Maintenance** app and click **Organisation unit > Organisation unit level**.

The loading time of the list depends on the depth of the organisation unit hierarchy tree.

2. For the organisation unit levels you want to modify, type a name.
3. Select the number of offline levels.

## Note

You configure the default value in the **System Settings** app:

Open the **System Settings** app, click **General** and select a level in the **Max offline organisation unit levels** list.

4. Click **Save**.

### 18.6.7. Move organisation units within a hierarchy

You can move organisation units within in the hierarchy by changing the parent of a selected organisation unit.

1. Open the **Maintenance** app and click **Organisation unit > Hierarchy operations**.
2. In the left-hand hierarchy tree, select the organisation unit(s) you want to move.

## Note

If the selected organisation unit has sub-organisation units, all of them move to the new parent organisation unit.

3. In the right-hand hierarchy tree, select which organisation unit you want to move the selected organisation unit(s) to.
4. Click **Move x organisation units**, where x stands for the number of organisation units you have selected.

Your changes are immediately reflected in the left-hand side hierarchy tree.

### 18.6.8. Close an organisation unit

When you close an organisation unit, you can't register or edit events to this organisation unit in the **Event Capture** and **Tracker Capture** apps.

1. Open the **Maintenance** app and click **Organisation unit > Organisation unit**.
2. In the object list, click the options menu and select **Edit**.
3. Select a **Closed date**.
4. Click **Save**.

### 18.6.9. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

### 18.6.10. Change sharing settings for metadata objects

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and users groups that can view or edit a metadata object.

## Note

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.
2. In the object list, click the options menu and select **Sharing settings**.
3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.
4. Change sharing settings for the users and user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Close**.

### 18.6.11. Delete metadata objects

## Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

## Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

### 18.6.12. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

### 18.6.13. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

## Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

## Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.7. [Work in progress] Manage validation rules

### 18.7.1. About validation rules

A validation rule is based on an expression. The expression defines a relationship between data element values. The expression forms a condition with certain logical criteria.

The expression consists of:

- A left side
- A right side
- An operator

#### Example 18.12.

A validation rule asserting that the total number of vaccines given to infants is less than or equal to the total number of infants.

In the **Maintenance** app, you manage the following validation rule objects:

**Table 18.11.**

Object type	What you can do
Validation rule	Create, edit, clone, delete, show details, and translate
Validation rule group	Create, edit, clone, delete, share, show details, and translate
Validation notification	Create, edit, clone, delete, show details, and translate

#### 18.7.1.1. About sliding windows

You can use sliding windows to group data *across multiple periods* as opposed to selecting data for a *single period*. Sliding windows have a size, that is to say, the number of days to cover, a starting point and an end point. The example below shows a sliding window that is customized to display weekly periods, a predicator, and an expression that compares the number of cases against the threshold of the period. Whenever the threshold is exceeded, a warning message displays.

Period (weekly)	Week 1							Week 2							Week 3						
Period threshold	10							9							8						
Days	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21
Number of cases	1	0	1	2	0	3	1	1	1	2	0	4	2	2	1	5	3	2	3	2	1
Result 8 < 10																					

**Table 18.12. Different behavior of validation rules when you use or do not use sliding windows**

<b>With sliding windows</b>	<b>Without sliding windows</b>
Used only for event data.	Used for event data and aggregate data.
Data selection is based on a fixed number of days (periodType).	Data selection is always based on a period.
The position of the sliding window is always <i>relative to</i> the period being compared.	Data is always selected for the <i>same period</i> as the period being compared.

See also: How to use sliding windows when you're [Creating or editing a validation rule](#).

### 18.7.1.2. About validation rule groups

A validation rule group allows you to group related validation rules. When you run a [validation rule analysis](#), you can choose to run all of the validation rules in your system, or just the validation rules in one group.

### 18.7.1.3. About validation notifications

You can configure a validation rule analysis to automatically send notifications about validation errors to selected user groups. These messages are called *validation notifications*. They are sent via the internal DHIS2 messaging system.

You can send validation rule notifications as individual messages or as message summaries. This is useful, for example, if you want to send individual messages for high-priority disease outbreaks, and summaries for low-priority routine data validation errors.

## 18.7.2. Create or edit a validation rule

1. Open the **Maintenance** app and click **Validation > Validation rule**.
2. Click the add button.
3. Type a **Name**.

The name must be unique among the validation rules.

4. (Optional) In the **Code** field, assign a code.
5. (Optional) Type a **Description**.
6. Select an **Importance**: **High**, **Medium** or **Low**.
7. Select a **Period type**.
8. Select an **Operator**: **Compulsory pair**, **Equal to**, **Exclusive pair**, **Greater than**, **Greater than or equal to** or **Not equal to**.

The **Compulsory pair** operator allows to require that data values must be entered for a form for both left and right sides of the expression, or for neither side. This means that you can require that if one field in a form is filled, then one or more other fields must also be filled.

The **Exclusive pair** allows to assert that if any value exist on the left side then there should be no values on the right side (or vice versa). This means that data elements which compose the rule on either side should be mutually exclusive from each other, for a given time period / organisation unit /attribute option combo.

9. Create the left side of the expression:
  - a. Click **Left side**.
  - b. Select **Sliding window** if you want to view data relative to the period you are comparing.

See also [About validation rules](#).

- c. Select a **Missing value strategy**. This selection sets how the system evaluates a validation rule if data is missing.

Option	Description
Skip if any value is missing	The validation rule will be skipped if any of the values which compose the expression are missing. This is the default option.  Always select this option you use the <b>Exclusive pair</b> or <b>Compulsory pair</b> operator.
Skip if all values are missing	The validation rule will be skipped only if all of the operands which compose it are missing.
Never skip	The validation rule will never be skipped in case of missing data, and all missing operands will be treated effectively as a zero.

- d. Type a **Description**.

- e. Build an expression based on the available data elements, program objects, organisation units, counts and constants.

In the right pane, double-click the data objects you want to include in the expression. Combine with the mathematical operators located below the left pane.

- f. Click **Save**.

10 Create the right side of the expression:

- a. Click **Right side**.

- b. Select a **Missing value strategy**. This selection sets how the system evaluates a validation rule if data is missing.

Option	Description
Skip if any value is missing	The validation rule will be skipped if any of the values which compose the expression are missing. This is the default option.  Always select this option you use the <b>Exclusive pair</b> or <b>Compulsory pair</b> operator.
Skip if all values are missing	The validation rule will be skipped only if all of the operands which compose it are missing.
Never skip	The validation rule will never be skipped in case of missing data, and all missing operands will be treated effectively as a zero.

- c. Select **Sliding window** if you want to view data relative to the period you are comparing. See also [About validation rules](#).

- d. Type a **Description**.

- e. Build an expression based on the available data elements, program objects, organisation units, counts and constants.

In the right pane, double-click the data objects you want to include in the expression. Combine with the mathematical operators located below the left pane.

f. Click **Save**.

11 Click **Save**.

### 18.7.3. Create or edit a validation rule group

1. Open the **Maintenance** app and click **Validation > Validation rule group**.
2. Click the add button.
3. Type a **Name**.
4. (Optional) In the **Code** field, assign a code.
5. (Optional) Type a **Description**.
6. Double-click the **Validation rules** you want to assign to the group.
7. Click **Save**.

### 18.7.4. Create or edit a validation notification

1. Open the **Maintenance** app and click **Validation > Validation notification**.
2. Click the add button.
3. Type a **Name**.
4. (Optional) In the **Code** field, assign a code.
5. Select **Validation rules**.
6. Select **Recipient user groups**.
7. (Optional) Select **Notify users in hierarchy only**.

If you select this option, the system will filter the recipient users. (The system derives the recipient users from the recipient user groups.) The filter is based on which organisation unit the recipient user belongs to. The users linked to organisation units which are ancestors of the organisation unit where the violation took place will receive validation notifications. The system will ignore other users and these users won't receive validation notifications.

8. Create the message template:

a. Create the **Subject template**.

Double-click the parameters in the **Template variables** field to add them to your subject.

b. Create the **Message template**.

Double-click the parameter names in the **Template variables** field to add them to your message.

9. Click **Save**.

### 18.7.5. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

## 18.7.6. Change sharing settings for metadata objects

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and user groups that can view or edit a metadata object.

### Note

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.
2. In the object list, click the options menu and select **Sharing settings**.
3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.
4. Change sharing settings for the users and user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Close**.

## 18.7.7. Delete metadata objects

### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

### Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

## 18.7.8. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

## 18.7.9. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

## Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

## Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.8. Manage attributes

### 18.8.1. About attributes

You can use metadata attributes to add additional information to metadata objects. In addition to the standard attributes for each of these objects it may be useful to store information for additional attributes, for example the collection method for a data element.

The screenshot shows the DHIS2 Maintenance app interface for managing attributes. The top navigation bar includes 'dhis2', 'DHIS 2 Demo - Sierra Leone', 'Search apps', and a user icon. The main menu tabs are 'ALL', 'DATA ELEMENTS', 'DATA SET', 'INDICATORS', 'ORGANISATION UNITS' (which is highlighted in orange), and 'OTHER'. On the left, a sidebar lists 'Constant', 'Attribute' (which is selected and highlighted in blue), and 'Option set'. The main content area is titled 'Attribute'. It contains fields for 'Name (\*)', 'Code', 'Value type (\*)', and a dropdown for 'Option set'. Below these are several checkboxes for selecting attribute types: 'Mandatory', 'Unique', 'Data element', 'Data element group', 'Indicator', 'Indicator group', 'Data set', 'Organisation unit', and 'Organisation unit group'.

In the **Maintenance** app, you manage the following attribute objects:

**Table 18.13. Attribute objects in the Maintenance app**

Object type	Available functions
Attribute	Create, edit, clone, delete, show details and translate

## 18.8.2. Create or edit an attribute

1. Open the **Maintenance** app and click **Attribute**.
2. Click the add button.
3. In the **Name** field, type the name of the attribute.

Each attribute must have a unique name

4. (Optional) In the **Code** field, assign a code.
5. Select a **Value type**.

If the value supplied for the attribute does not match the value type you will get a warning.

6. Select an **Option set**.
7. Select the options you want, for example:
  - Select **Mandatory** if you want an object to always have the dynamic attribute.
  - Select **Unique** if you want the system to enforce that values are unique for a specific object type.
8. Click **Save**.

The dynamic attribute is now available for the objects you assigned it to.

## 18.8.3. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

## 18.8.4. Delete metadata objects

### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

### Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

## 18.8.5. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

## 18.8.6. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

### Tip

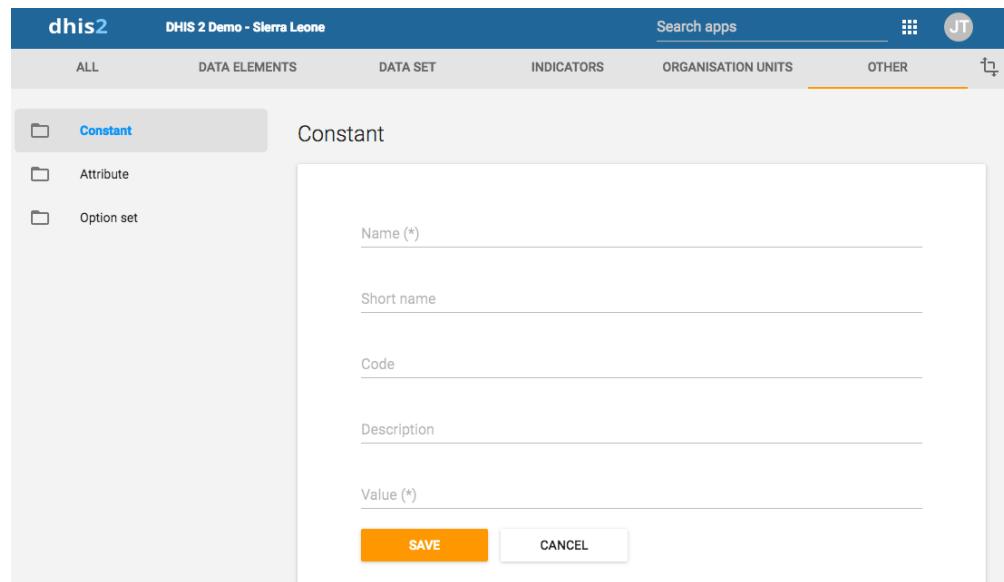

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.9. Manage constants

### 18.9.1. About constants

Constants are static values which can be made available to users for use in data elements and indicators. Some indicators, such as "Couple year protection rate" depend on constants which usually do not change over time.

The screenshot shows the DHIS2 Maintenance app interface. The top navigation bar includes 'dhis2', 'DHIS 2 Demo - Sierra Leone', 'Search apps', and a user icon. Below the bar, there are tabs for 'ALL', 'DATA ELEMENTS', 'DATA SET', 'INDICATORS', 'ORGANISATION UNITS', and 'OTHER'. The 'OTHER' tab is selected. On the left, a sidebar lists 'Constant' (which is selected and highlighted in blue), 'Attribute', and 'Option set'. The main content area is titled 'Constant'. It contains five input fields: 'Name (\*)', 'Short name', 'Code', 'Description', and 'Value (\*')'. At the bottom are two buttons: 'SAVE' (highlighted in orange) and 'CANCEL'.

In the **Maintenance** app, you manage the following constant objects:

**Table 18.14. Constant objects in the Maintenance app**

Object type	Available functions
Constant	Create, edit, clone, share, delete, show details and translate

## 18.9.2. Create or edit a constant

1. Open the **Maintenance** app and click **Other > Constant**.
2. Click the add button.
3. In the **Name** field, type the name of the constant.
4. (Optional) In the **Short name** field, type an abbreviated name of the constant.
5. (Optional) In the **Code** field, assign a code.
6. In the **Description** field, type a brief, informative description of the constant.
7. In the **Value** field, define the constant's value.
8. Click **Save**.

The constant is now available for use.

## 18.9.3. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

## 18.9.4. Change sharing settings for metadata objects

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and users groups that can view or edit a metadata object.

### Note

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.
2. In the object list, click the options menu and select **Sharing settings**.
3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.
4. Change sharing settings for the users and user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Close**.

## 18.9.5. Delete metadata objects

### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

## Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

### 18.9.6. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

### 18.9.7. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

#### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

#### Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

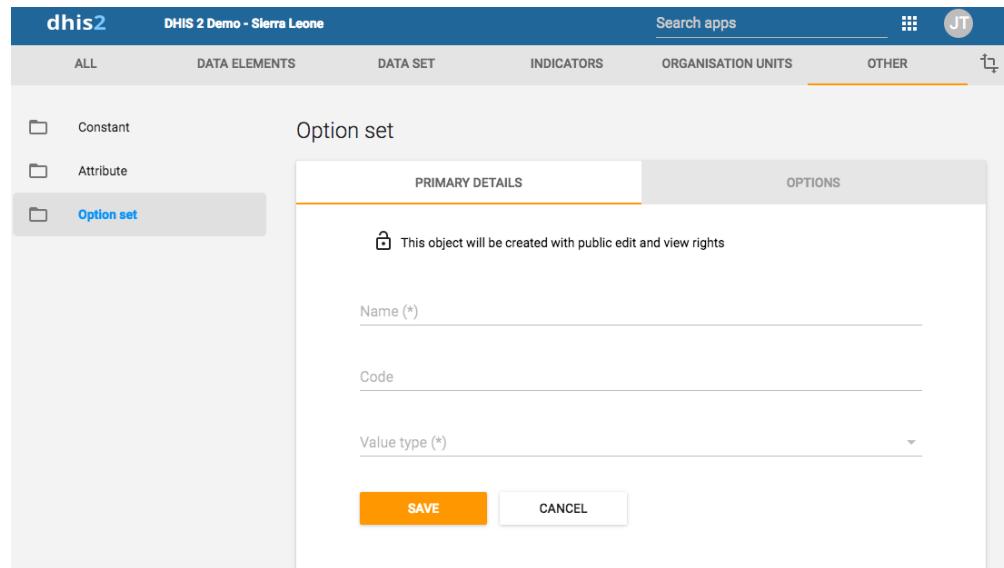

## 18.10. Manage option sets

### 18.10.1. About option sets

Option sets provide a pre-defined drop-down (enumerated) list for use in DHIS2. You can define any kind of options.

#### Example 18.13.

An option set called "Delivery type" would have the options: "Normal", "Breach", "Caesarian" and "Assisted".

**Table 18.15. Option set objects in the Maintenance app**

Object type	Available functions
Option set	Create, edit, clone, share, delete, show details and translate

## 18.10.2. Create or edit an option set

### Important

Option sets must have a code as well as a name. You can change the names but you can't change the codes. Both names and codes of all options must be unique, even across different option sets.

1. Open the **Maintenance** app and click **Other > Option set**.
2. Click the add button.
3. In the **Primary details** tab, define the option set:
  - a. In the **Name** field, type the name of the constant.
  - b. In the **Code** field, assign a code.
  - c. Select a **Value type**.
  - d. Click **Save**.
4. For each option you need, perform the following tasks:
  - a. Click the **Options** tab.
  - b. Click the add button.
  - c. Type a **Name** and a **Code**.
  - d. Sort the options by name, code/value or manually.
  - e. Click **Save**.

## 18.10.3. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.

- 
4. Click **Save**.

#### 18.10.4. Change sharing settings for metadata objects

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and user groups that can view or edit a metadata object.

##### Note

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.
2. In the object list, click the options menu and select **Sharing settings**.
3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.
4. Change sharing settings for the users and user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Close**.

#### 18.10.5. Delete metadata objects

##### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

##### Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

#### 18.10.6. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

#### 18.10.7. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

## Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

## Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.11. Manage legends

### 18.11.1. About legends

You can create, edit, clone, delete, show details and translate legends to make the maps you're setting up for your users meaningful. You create maps in the **GIS** app.

## Note

Continuous legends must consist of legend items that end and start with the same value, for example: 0-50 and 50-80. Do not set legend items like this: 0-50 and 51-80. This will create gaps in your legend.

### 18.11.2. Create or edit a legend

## Note

It is not allowed to have gaps in a legend.

It is not allowed to have overlapping legend items.

1. Open the **Maintenance** app and click **Other > Legend**.
2. Click the add button.
3. In the **Name** field, type the legend name.
4. (Optional) In the **Code** field, assign a code.
5. Create the legend items you want to have in your legend:
  - a. Select **Start value** and **End value**.
  - b. Select **Number of legend items**.
  - c. Select a color scheme.
  - d. Click **Create legend items**.

## Tip

Click the options menu to edit or delete a legend item.

6. (Optional) Add more legend items:
  - a. Click the add button.
  - b. Enter a name and select a start value, an end value and a color.
  - c. Click **OK**.
7. (Optional) Change the color scales.
  - a. Click the colour scale to view a list of color scale options, and select a color scale.
  - b. To customize a color scale, click the add button. In the **Edit legend item** dialog, click the color scale button and handpick colors, or enter your color values.
8. Click **Save**.

#### **Example 18.14. Vaccination coverage legends**

**Table 18.16.**

<b>Legend item</b>	<b>Start value</b>	<b>End value</b>
Low bad	0	50
Medium	50	80
High good	80	100
Too high	100	1000

### **18.11.3. Clone metadata objects**

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

### **18.11.4. Change sharing settings for metadata objects**

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and users groups that can view or edit a metadata object.

#### **Note**

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.
2. In the object list, click the options menu and select **Sharing settings**.
3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.
4. Change sharing settings for the users and user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Close**.

## 18.11.5. Delete metadata objects

### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

### Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

## 18.11.6. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

## 18.11.7. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

### Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.11.8. Assign a legend to indicator or data element

You can assign a legend to an indicator or a data element in the **Maintenance** app, either when you create the object or edit it. When you then select the indicator or data element in the **GIS** app, the system automatically selects the assigned legend.

## 18.11.9. See also

- [Using the GIS app](#)

## 18.12. Manage predictors

### 18.12.1. About predictors

Predictors are data elements that are automatically generated from samples of current and past data. You use predictors to analyse previous data in order to predict future values, for example for disease surveillance.

A predictor specifies an expression and a set of sample constraints, identical to the implementation of validation rules. This includes a period type, organisation unit levels, and parameters specifying past or periodic sample windows. The expression should evaluate to true or false.

In the **Maintenance** app, you manage the following predictor objects:

**Table 18.17. Predictor objects in the Maintenance app**

Object type	Available functions
Predictor	Create, edit, clone, delete, show details and translate

### 18.12.2. Create or edit a predictor

1. Open the **Maintenance** app and click **Other > Predictor**.
2. Click the add button.
3. In the **Name** field, type the predictor name.
4. (Optional) In the **Code** field, assign a code.
5. Select an **Output data element**.
6. (Optional) Type a **Description**.
7. Select a **Period type**.
8. (Optional) Assign organisation unit levels.
9. Create a **Generator**.

The generator is the expression that is used to calculate the predicted value.

10(Optional) Click **Sample skip test** and create an expression which is used to exclude data from the generation process. The expression should evaluate to true or false.

#### **Example 18.15.**

Use the sample skip test when you want to calculate the average number of malaria cases and you want to exclude the "spikes" you get from outbreaks.

11Enter a **Sequential sample count** value.

This value decides for how many sequential periods the calculation should go back in time to collect data for the calculations. The sequential sample count depends on the value type.

#### **Example 18.16.**

If the period type is "Monthly" and the sequential sample count is "3", the predictor calculations will include data three months back in time.

12Enter an **Annual sample count** value.

This value decides for how many years the calculation should go back in time to collect data for the calculations. The annual sample count depends on the value type and sequential sample count.

**Example 18.17.**

If the period type is "Monthly", the sequential sample count is "3" and the annual sample count is "4", the predictor calculations will include data three months back in time for this year and for two (3-1) years back in time:

June, July, August 2016; June, July, August, 2015; and June, July, August 2014.

13(Optional) Enter a **Sequential skip count** value.

This value decides how many periods the calculation should go back in time before the sequential sample count starts. The sequential skip count depends on the value type and sequential sample count.

**Example 18.18.**

If the period type is "Monthly", the sequential sample count is "3" and the sequential sample count is "2", the predictor calculations will go back two months in time, then include the following three months in the calculations:

April, May and June (July and August are skipped because the sequential skip count is "2")

14Click **Save**.

### 18.12.3. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

### 18.12.4. Delete metadata objects

#### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

#### Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

### 18.12.5. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

## 18.12.6. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

### Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.13. Manage push reports

### 18.13.1. About push reports

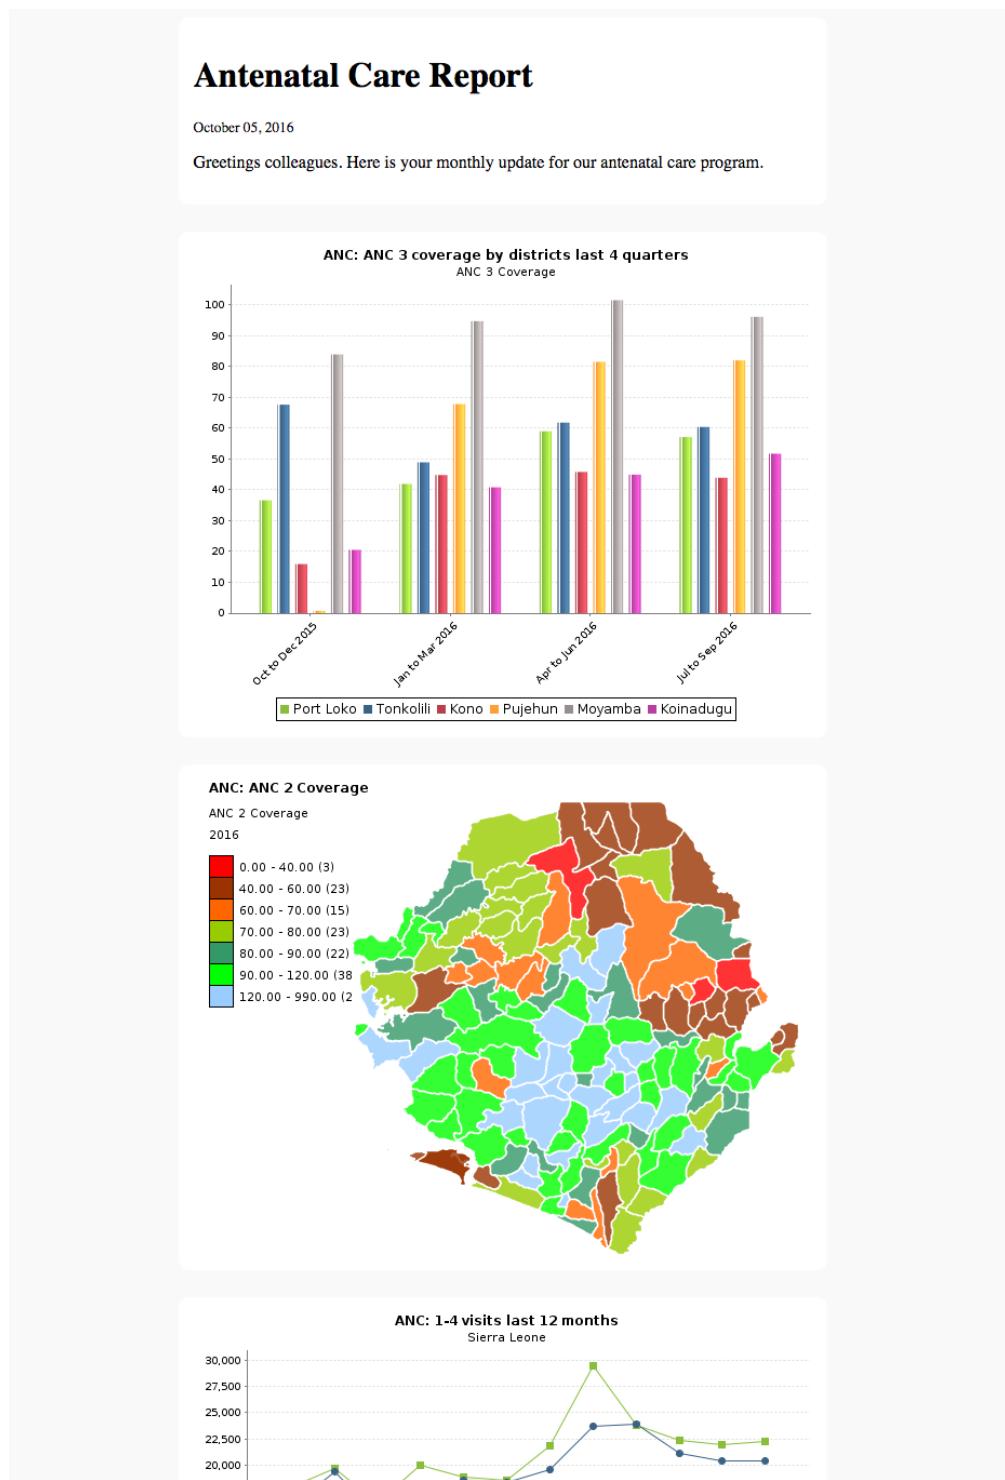

Push reports allows you to increase awareness and usage of data analysis by sending reports with charts, tables and maps directly to users e-mail addresses.

- A push report gets its content from existing dashboards.
- A push report lists the dashboard items in the same order as on the dashboard.
- A push report can only contain dashboard items with charts, maps or tables.
- You create the push report and its schedule in the **Maintenance** app.
- The **Title** and **Message** parameters you set up in the **Maintenance** app, are included in each report. The **Name** you give the report is not included in the report. Instead, the name is used to identify the push analysis object in the system. This way a report can be named one thing, and the title of the report can be another.
- When you run a push report job, the system compiles a list of recipients from the user groups you've selected. The system then generates a report for each member of the selected user groups. Each of the dashboard items are generated specifically for each user. This means that the data included in the report reflects the data the user has access to. All users could therefore get the same report (if all the data is "static") or custom reports (if all the data is "dynamic"), or a combination of the two.
- Push reports are sent by e-mail to the recipients, not through the internal DHIS2 messaging system. If a user doesn't have a valid e-mail, or if the job fails, no e-mails are sent. In this case, the problem is logged on the server.

### Note

The data generated in the push reports is public so verify that you don't include any sensitive data.

### Example 18.19. Push report

In the **Maintenance** app, you manage the following push reports objects:

**Table 18.18. Push reports objects in the Maintenance app**

Object type	Available functions
Push analysis	Create, edit, clone, delete, show details, translate, preview and run

#### 18.13.2. Create or edit a push report

1. Open the **Maintenance** app and click **Other > Push analysis**.
2. Click the add button.

3. In the **Name** field, type the name of the scheduled report.

This name is not included in the report e-mail. Instead, the name is used to identify the push analysis object in the system.

4. (Optional) In the **Code** field, assign a code.
5. Add a report **Title**.

This title is included in the report e-mail.

6. (Optional) Add a **Message**.

This message is included in the report e-mail.

7. Select a **Dashboard** to base the report on.
8. Select and assign the user groups you want to send the report to.
9. Select a **Scheduling frequency**: **Daily**, **Weekly** or **Monthly**.

### Note

If you schedule a push report to "Monthly" and "31", the scheduled report job will not run if the month has less than 31 days.

- 10(Optional) Select **Enable** to activate the push report job.

The job won't run until you activate it.

- 11Click **Save**.

#### 18.13.3. Preview push reports

1. Open the **Maintenance** app and click **Other > Push analysis**.
2. In the push report list, locate the push report you want to preview.
3. Click the options menu and select **Preview**.

A preview of the push report opens in a new window.

#### 18.13.4. Run push report jobs

1. Open the **Maintenance** app and click **Other > Push analysis**.
2. In the push report list, locate the push report you want to run.
3. Click the options menu and select **Run now**.

The push report job runs immediately.

#### 18.13.5. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

#### 18.13.6. Delete metadata objects

### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

## Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

### 18.13.7. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

### 18.13.8. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

#### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

#### Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.14. Manage external map layers

### 18.14.1. About external map layers

You can customize GIS by including map layers from various sources and combine them with your own data in DHIS2. DHIS2 supports common map service formats such as Web Map Service (WMS), Tile Map Service (TMS) and XYZ tiles.

### 18.14.2. Create or edit an external map layer

#### Note

DHIS 2 only supports the Web Mercator projection ([EPSG:3857](#)) so make sure that the external service supports this projection.

**Table 18.19. External map layer objects in the Maintenance app**

Object type	Available functions
External map layer	Create, edit, clone, delete, show details and translate

1. Open the **Maintenance** app and click **Other > External map layer**.
2. Click the add button.
3. In the **Name** field, type a name that describes the content of the external map layer.  
This is the name you'll see in the **GIS** app.
4. (Optional) In the **Code** field, assign a code.
5. Select a **Map service** format.

DHIS2 supports three common map service formats:

- Web Map Service (WMS)

**Image format:** PNG format allows layers to be transparent, JPG format offers better compression and is often faster to load.

**Layers:** A WMS can contain several individual layers, and you can specify which you want to include (comma separated). Refer to the WMS GetCapabilities document to see the available layers.

- Tile Map Service (TMS)
- XYZ tiles (can also be used for WMTS)

6. Enter the **URL** to the map service.

## Note

XYZ and TMS URLs must contain placeholders {}, for example: <http://{s}.tile.osm.org/{z}/{x}/{y}.png>.

7. (Optional) Enter **Source** of the map layers. The field can contain HTML tags if you want to link to the source.

When you use an external map service it is important to highlight where the data comes from.

8. Select a **Placement**:

- **Bottom - basemap**: places the external map layer above other DHIS2 base maps but below the thematic map layers.
- **Top - overlay**: places the external map layer above the thematic map layers but below facility and event data layers.

9. (Optional) Add a legend.

You can add a legend in two ways:

- Select a predefined **Legend** to describe the colors of the map layer.

## Tip

Click **Add new** to create legends that you're missing. In the form that opens, create the legends you need. When you're done, click **Refresh values**.

- Enter a link to an external image legend in **Legend image URL**.

These are often provided for WMS. See under LegendURL in the WMS GetCapabilites document.

10Click **Save**.

### 18.14.3. Clone metadata objects

- Cloning a data element or other objects can save time when you create many similar objects.
1. Open the **Maintenance** app and find the type of metadata object you want to clone.
  2. In the object list, click the options menu and select **Clone**.
  3. Modify the options you want.
  4. Click **Save**.

### 18.14.4. Delete metadata objects

#### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

#### Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

### 18.14.5. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

### 18.14.6. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

#### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

#### Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 18.15. Edit multiple object groups at once

The **Metadata group editor** in the **Maintenance** app allows you to edit multiple object groups at the same time. You can edit the following objects types:

**Table 18.20. Object types in the Metadata group editor**

Object type	Available functions
Category option	
Category option group	
Data element	Add one data element to multiple data element groups Remove one data element from multiple data element groups
Data element group	Add multiple data elements to one data element group Remove multiple data elements from one data element group
Indicator	Add one indicator to multiple indicator groups Remove one indicator from multiple indicator groups
Indicator group	Add multiple indicators to one indicator group Remove multiple indicators from one indicator group

### 18.15.1. Edit multiple objects in an object group

1. Open the **Maintenance** app and click **Metadata group editor**.
2. Click **Manage items in group**.
3. Select an object group type, for example **Indicator groups**.
4. Select an object group, for example **HIV**.
5. In the left-hand list, select the object(s) you want to add to the object group and click the right arrow.
6. In the right-hand list, select the object(s) you want to remove from the object group and click the left arrow.

### 18.15.2. Edit an object in multiple object groups

1. Open the **Maintenance** app and click **Metadata group editor**.
2. Click **Manage groups for item**.
3. Select an object type, for example **Indicators**.
4. Select an object, for example **ANC LLITN coverage**.
5. In the left-hand list, select the objects group(s) you want to add the object to and click the right arrow.
6. In the right-hand list, select the object group(s) you want to remove the object from and click the left arrow,

# Chapter 19. Configure programs in the Maintenance app

## 19.1. About programs

Traditionally, public health information systems have been reporting aggregated data of service provision across its health programs. This does not allow you to trace the people provided with these services. In DHIS2, you can define your own programs with stages. These programs are a essential part of the "tracker" functionality which lets you track individual records. You can also track other 'entities' such as wells or insurances. You can create two types of programs:

**Table 19.1. Program types**

Program type	Description	Examples of use
Event program	<p>Single event <i>without</i> registration program (anonymous program or SEWoR)</p> <p>Anonymous, individual events are tracked through the health system. No person or entity is attached to these individual transactions.</p> <p>Has only one program stage.</p>	<p>To record health cases without registering any information into the system.</p> <p>To record survey data or surveillance line-listing.</p>
Tracker program	<p>Single event <i>with</i> registration program (SEWR)</p> <p>An entity (person, commodity, etc.) is tracked through each individual transaction with the health system</p> <p>Has only one program stage.</p> <p>A tracked entity instance (TEI) can only enroll in the program once.</p>	<p>To record birth certificate and death certificate.</p>
	<p>Multi events <i>with</i> registration program (MEWR)</p> <p>An entity (person, commodity, etc.) is tracked through each individual transaction with the health system</p>	<p>Mother Health Program with stages as ANC Visit (2-4+), Delivery, PNC Visit.</p>

Program type	Description	Examples of use
	Has multiple program stages.	

To create a program, you must first configure several types of metadata objects. You create these metadata objects in the **Maintenance** app or the **Program / Attributes** (legacy) app.

**Table 19.2. Program metadata objects in the Maintenance app**

Object type	Description	Available functions
Event program	A program to record single event without registration	Create, edit, share, delete, show details and translate
Program indicator	An expression based on data elements and attributes of tracked entities which you use to calculate values based on a formula.	Create, edit, share, delete, show details and translate
Program rule	Allows you to create and control dynamic behavior of the user interface in the <b>Tracker Capture</b> and <b>Event Capture</b> apps.	Create, edit, delete, show details and translate
Program rule variable	Variables you use to create program rule expressions.	Create, edit, delete, show details and translate
Relationship type	Defines the relationship between tracked entity A and tracked entity B, for example mother and child.	Create, edit, clone, delete, show details and translate
Tracked entity	<p>Types of entities which can be tracked through the system. Can be anything from persons to commodities, for example a medicine or a person.</p> <p>A program must have one tracked entity. To enrol a tracked entity instance into a program, the tracked entity of an entity and tracked entity of a program must be the same.</p> <p> <b>Note</b></p> <p>A program must be specified with only one tracked entity. Only tracked entity as same as the tracked entity of program can enroll into that program.</p>	Create, edit, clone, delete, show details and translate

Object type	Description	Available functions
Tracked entity attribute	Used to register extra information for a tracked entity.  Can be shared between programs.	Create, edit, clone, share, delete, show details and translate

**Table 19.3. Program metadata objects in the Program / Attributes app**

Object type	Description	Available functions
Program	A program consist of program stages.	Create, edit, share, delete, assign to organisation units, show details and translate
Program stage	A program stage defines which actions should be taken at each stage.	Create, edit, change sort order, delete, show details and translate
Program stage section	N/A	Create, edit, change sort order, delete, show details and translate
Program indicator group	A group of program indicators	Create, edit, delete, show details and translate
Validation rule	A validation rule is based on an expression which defines a relationship between data element values.	Create, edit and delete
Program notification	Automated message reminder  Set reminders to be automatically sent to enrolled tracked entity instances before scheduled appointments and after missed visits.	Create, edit and delete
Program stage notification	-	Create, edit and delete
Design custom registration form	-	-

## 19.2. Configure event programs in the Maintenance app

### 19.2.1. About event programs

Single event *without* registration programs are called event programs. You configure them in the **Maintenance** app. Event programs can have three types of data entry forms:

**Table 19.4. Types of data entry forms for event programs**

Form type	Description
Basic	Lists all data elements which belong to the program. You can change the order of the data elements.

Form type	Description
Section	A section groups data elements. You can then arrange the order of the sections to create the desired layout of the data entry form.
Custom	Defines the data entry form as HTML page.

### Note

- Custom forms takes precedence over section forms if both are present.
- If no custom or section form are defined, the basic form will be used.
- The Android apps only supports section forms.

You can create *program notifications* for event programs. The notifications are sent either via the internal DHIS2 messaging system, via e-mail or via text messages (SMS). You can use program notifications to, for example, send an automatic reminder to a tracked entity 10 days before a scheduled appointment. You use the program's tracked entity attributes (for example first name) and program parameters (for example enrollment date) to create a notification template. In the **Parameters** field, you'll find a list of available tracked entity attributes and program parameters.

## 19.2.2. Workflow: Create an event program

1. Enter the event program details.
2. Assign data elements.
3. Create data entry form(s): **Basic, Section or Custom**.
4. Assign the program to organisation unit(s).
5. Create program notification(s).

## 19.2.3. Create or edit an event program

### 19.2.3.1. Enter event program details

1. Open the **Maintenance** app and click **Program > Program**.
2. Click the add button.
3. Enter program details, then click next.

Field	Description
<b>Name</b>	The name of the program.
<b>Short name</b>	A short name of the program. The short name is used as the default chart or table title in the analytics apps.
<b>Description</b>	A detailed description of the program.
<b>Version</b>	The version of the program. This is used for example when people collect data offline in an Android implementation. When they go online and synchronize their metadata, they should get the latest version of the program.
<b>Category combination</b>	The category combination you want to use. The default setting is <b>None</b> .
<b>Data approval workflow</b>	The data approval workflow you want to use. The default setting is <b>No value</b> .

Field	Description
<b>Completed events expiry date</b>	<p>Defines the number of days for which you can edit a completed event. This means that when an event is completed and the specified number of expiry days has passed, the event is locked.</p> <p><b>Example 19.1.</b></p> <p>If you set "Completed events expiry days" to 10", an event is locked ten days after the completion date. After this date you can no longer edit the event.</p>
<b>Expiry period type</b> <b>Expiry days</b>	<p>The expiry days defines for how many days after the end of the previous period, an event can be edited. The period type is defined by the expiry period type. This means that when the specified number of expiry days has passed since the end date of the previous period, the events from that period are locked.</p> <p><b>Example 19.2.</b></p> <p>If you set the expiry type to "Monthly" and the expiry days to "10" and the month is October, then you can't add or edit an event to October after the 10th of November.</p>

4. Click next.

### 19.2.3.2. Assign data elements

1. Click **Assign data elements**.
2. In the list of available items, double-click the data elements you want to assign to the event program.
3. (Optional) For each data element, add additional settings:

Setting	Description
<b>Compulsory</b>	The value of this data element must be filled into data entry form before you can complete the event.
<b>Allow provided elsewhere</b>	Specify if the value of this data element comes from other facility, not in the facility where this data is entered.
<b>Display in reports</b>	Displays the value of this data element into the single event without registration data entry function.
<b>Date in future</b>	Will allow user to select a date in future for date data elements.
<b>Render option as radio</b>	Displays a radio button in the data entry form. It's only possible to use for option sets.

4. Click next.

### 19.2.3.3. Create data entry forms

The data entry forms decide how the data elements will be displayed to the user in the **Event Capture** app.

1. Click **Create data entry form**.
2. Click **Basic, Section** or **Custom**.
3. To create a **Basic** data entry form: Drag and drop the data elements in the order you want.
4. To create a **Section** data entry form:
  - a. Click the add button and enter a section name.
  - b. Click the section so it's highlighted by a black line.
  - c. Add data elements by clicking the plus sign next to the data elements' names.
  - d. Repeat above steps until you've all the sections you need.
  - e. Change the section order: click the options menu, then drag the section to the place you want.
5. To create a **Custom** data entry from: Use the WYSIWYG editor to create a completely customized form. If you select **Source**, you can paste HTML code directly in the editing area. You can also insert images for example flags or logos.
6. Click next.

### 19.2.3.4. Assign organisation units

1. Click **Assign organisation units**.
2. In the organisation tree, double-click the organisation units you want to add to the program to.

You can locate an organisation unit in the tree by expanding the branches (click on the arrow symbol), or by searching for it by name. The selected organisation units display in orange.

3. Click next.

### 19.2.3.5. Create program notifications

1. Create the message you want to send:
  - a. Click **What to send?**.
  - b. Enter a **Name**.
  - c. Create the **Subject template**: Double-click the parameters in the **Template variables** field to add them to your subject.

#### Note

The subject is not included in text messages.

- d. Create the **Message template**: Double-click the parameter names in the **Template variables** list to add them to your message.

#### Example 19.3.

Dear A{w75Kj2mc4zz}, You're now enrolled in V{program\_name}.

2. Define *when* you want to send the message:
  - a. Click **When to send it?**.
  - b. Select a **Notification trigger**.

Notification trigger	Description
Program stage completion	The program stage notification is sent when the program stage is completed

Notification trigger	Description
Days scheduled (due date)	<p>The program stage notification is sent XX number of days before or after the due date</p> <p>You need to enter the number of days before or after the scheduled date that the notification will be send.</p>

3. Define *who* you want to send the message to:

- Click **Who to send it to?**.
- Select a **Notification recipient**.

Notification recipient	Description
Tracked entity instance	<p>Receives program notifications via e-mail or text message.</p> <p>To receive a program notification, the recipient must have an e-mail address or a phone number attribute.</p>
Organisation unit contact	<p>Receives program notifications via e-mail or text message.</p> <p>To receive a program notification, the receiving organisation unit must have a registered contact person with e-mail address and phone number.</p>
Users at organisation unit	All users registered to the selected organisation unit receive program notifications via the internal DHIS2 messaging system.
User group	All members of the selected user group receive the program notifications via the internal DHIS2 messaging system
Program	TBA

c. Click **Save**.

4. Repeat above steps to create all the program notifications you need.

5. Click **Save**.

## Note

You configure when the program notifications are sent in the **Data Administration** app > **Scheduling > Program notifications scheduler**.

- Click **Run now** to send the program notifications immediately.
- Select a time and click **Start** to schedule the program notifications to be send at a specific time.

### 19.2.4. Reference information: Program notification parameters

**Table 19.5. Program notification parameters to use in program notifications**

Notification type	Variable name	Variable code
Program	Current date	V{current_date}

<b>Notification type</b>	<b>Variable name</b>	<b>Variable code</b>
	Days since enrollment date	V{days_since_enrollment_date}
	Enrollment date	V{enrollment_date}
	Incident date	V{incident_date}
	Organisation unit name	V{org_unit_name}
	Program name	V{program_name}
Program stage	Current date	V{current_date}
	Days since due date	V{days_since_due_date}
	Days until due date	V{days_until_due_date}
	Due date	V{due_date}
	Organisation unit name	V{org_unit_name}
	Program name	V{program_name}
	Program stage name	V{program_stage_name}

## 19.3. Configure tracker programs in the Maintenance app

### Note

From release 2.27, you create event programs (programs without registration) in the **Maintenance** app. You still create tracker programs (programs with registration) in the **Program / Attributes** app.

## 19.4. Configure program indicators

### 19.4.1. About program indicators

Program indicators are expressions based on data elements and attributes of tracked entities which can be used to calculate values based on a formula. Program indicators consist of an aggregation type, an analytics type, an expression and a filter.

Program indicators are evaluated based on the assigned aggregation type, expression and filter. The order of evaluation is:

1. The *filter* will filter the events which become part of the evaluation/aggregation routine.
2. The *expression* will be evaluated per event.
3. All evaluated expression values will be *aggregated* according to the aggregation type of the program indicator.

**Table 19.6. Program indicator components**

<b>Program rule component</b>	<b>Description</b>
Aggregation type	<p>The aggregation type determines how the program indicator will be aggregated. The following aggregation types are available:</p> <ul style="list-style-type: none"> <li>• Average</li> <li>• Average (number)</li> <li>• Average (number, disaggregation)</li> </ul>

Program rule component	Description
	<ul style="list-style-type: none"> <li>• Average (sum in organisation unit hierarchy)</li> <li>• Average (sum of numbers)</li> <li>• Average (sum of numbers, disaggregation)</li> <li>• Average (Yes/No)</li> <li>• Count</li> <li>• Custom</li> </ul> <p>The "custom" aggregation type allows you to specify the aggregation type in-line in the expression. All other aggregation types are applied to the entire expression.</p> <p>Using the "custom" aggregation type might lead to an exception of the order of evaluation described above where individual parts of the expression can be evaluated and aggregated, as opposed to the entire expression being evaluated prior to aggregation.</p> <ul style="list-style-type: none"> <li>• Default</li> <li>• Max</li> <li>• Min</li> <li>• None</li> <li>• Standard deviation</li> <li>• Sum</li> <li>• Variance</li> </ul>
Analytics type	<p>The available analytics types are <i>event</i> and <i>enrollment</i>.</p> <p>The analytics type defines whether the program indicator is calculated based on events or program enrollments. This has an impact on what type of calculations can be made.</p> <ul style="list-style-type: none"> <li>• Events implies a data source where each event exists as an independent row. This is suitable for performing aggregations such as counts and sums.</li> <li>• Enrollments implies a data source where all events for a single enrollment is combined on the same row. This allows for calculations which can compare event data from various program stages within a program enrollment.</li> </ul>
Expression	The expression defines how the indicator is being calculated. The expression can contain references to various entities which

Program rule component	Description
	<p>will be substituted with a related values when the indicator is calculated:</p> <ul style="list-style-type: none"> <li>• Data elements: Will be substituted with the value of the data element for the time period and organisation unit for which the calculation is done. Refers to both program stage and data element.</li> <li>• Attributes: Will be substituted with the value of the attribute for the person / tracked entity for which the calculation is done.</li> <li>• Variables: Will be substituted with special values linked to the program, including incident date and date of enrollment for the person, current date and count of values in the expression for the time period and organisation unit for which the calculation is done.</li> <li>• Constants: Will be substituted with the value of the constant.</li> </ul> <p>The expression is a mathematical expression and can also contain operators.</p> <p>For single event programs and tracker programs with analytics type <i>event</i>, the expression will be evaluated <i>per event</i>, then aggregated according to its aggregation type.</p> <p>For tracker programs with analytics type <i>enrollment</i>, the expression will be evaluated <i>per enrollment</i>, then aggregated according to its aggregation type.</p>
Filter	<p>The filter is applied to events and filters the data source used for the calculation of the indicator. I.e. the filter is applied to the set of events before the indicator expression is being evaluated. The filter must evaluate to either true or false. If the filter evaluates to true then the event is included later in the expression evaluation, if not it is ignored. The filter can, in a similar way as expressions, contain references to data elements, attributes and constants.</p> <p>The program indicator filter can in addition use logical operators. These operators can be used to form logical expressions which ultimately evaluate to either true or false. For example you can assert that multiple data elements must be a specific value, or</p>

Program rule component	Description
	that specific attributes must have numerical values less or greater than a constant.

In the **Maintenance** app, you manage the following program indicator objects:

Object type	Available functions
Program indicator	Create, edit, clone, share, delete, show details and translate
Program indicator group	Create, edit, clone, share, delete, show details and translate

## 19.4.2. Create or edit a program indicator

### Note

A program indicator belongs to exactly one program.

1. Open the **Maintenance** app and click **Indicator > Program indicator**.
2. Click the add button.
3. Select a **Program** and enter:
  - **Name**
  - **Short name**
  - **Code**
  - **Description**
4. Select number of **Decimals in data output**.
5. Select an **Aggregation type**.
6. Select a if you want to **Display in form**.
7. Assign one or multiple **Legends**.
8. (Optional) Enter a **Category option combination for aggregate data export**.
9. (Optional) Enter an **Attribute option combination for aggregate data export**.
10. Create the expression.
  - a. Click **Edit expression**.
  - b. Create the expression based on mathematical operators and the attributes, variables and constants listed to the right.
11. Create the filter.
  - a. Click **Edit filter**.
  - b. Create the expression based on mathematical operators and the attributes, variables and constants listed to the right.
12. Click **Save**.

## 19.4.3. Create or edit a program indicator group

1. Open the **Maintenance** app and click **Indicator > Program indicator group**.
2. Click the add button.
3. Enter **Name** and **Code**.
4. In the list of available program indicators, double-click the program indicators you want to assign to your group.

5. Click **Save**.

#### 19.4.4. Reference information: Expression and filter examples per value type

The table below shows examples of how to write expressions and filters for different data element and attribute value types:

**Table 19.7. Expression and filter examples per value type**

Value types	Example syntax
Integer	Numeric fields, can be used for aggregation as an expression, or in filters:
Negative integer	
Positive or zero integer	#{mCXR7u4kNBW.K0A4BauXJD1} >= 3
Positive integer	
Number	
Percentage	
Yes/No	Boolean fields. Yes is translated to numeric 1, No to numeric 0. Can be used for aggregation as an expression, or in filters:
Yes only	#{mCXR7u4kNBW.PopA3BauXJss} == 1
Text	Text fields. Can be checked for equality in filters:
Long text	#{mCXR7u4kNBW.L8K4BauIKs1} == 'LiteralValue'
Phone number	
Email	
Date	Date fields. Most useful when combined with a d2:daysBetween function, which produces a number that can be aggregated as an expression or used in filters:
Age	d2:daysBetween(#{mCXR7u4kNBW.JKJKBauss1}, V{enrol > 100}
	Can also directly be checked for equality in filters:
	#{mCXR7u4kNBW.JKJKBauss1} == '2011-10-28'
Date	Date fields. Most useful when combined with a d2:daysBetween function, which produces a number that can be aggregated as an expression or used in filters:
Age	d2:daysBetween(#{mCXR7u4kNBW.JKJKBauss1}, V{enrol > 100}
	Can also directly be checked for equality in filters:

Value types	Example syntax
	# {mCXR7u4kNBW.JKJKBaussl} == '2011-10-28'

## 19.4.5. Reference information: Functions, variables and operators to use in program indicator expressions and filters

### Example 19.4.

An expression that includes both attributes, data elements and constants looks like this:

```
(A{GPkGfbmArby} + # {mCXR7u4kNBW.NFkjsNiQ9PH}) * C{bCqvfPR02Im}
```

### Example 19.5.

An expression which uses the custom aggregation type and hence can use inline aggregation types looks like this:

```
(sum(# {mCXR7u4kNBW.K0A4BauXJD1} * # {mCXR7u4kNBW.NFkjsNiQ9PH}) / sum(# {mCXR7u4kNBW.NFkjsNiQ9PH})) * 100
```

Note how the "sum" aggregation operator is used inside the expression itself.

### 19.4.5.1. Functions to use in a program indicator expression or filter

The program indicator expression and filter support a range of functions. The functions can be applied to data elements and attributes:

**Table 19.8. Functions to use in a program indicator expression or filter**

Function	Arguments	Description
d2:hasValue	(object)	Returns true if the data element/attribute has a value. Can be used in filters to distinguish between the number 0 and no value, and to distinguish between explicit "No" and no selection for a Yes/No field.
d2:daysBetween	(date, date)	Produces the number of days between two data elements/attributes of type date. The static date format is 'yyyy-MM-dd'.
d2:weeksBetween	(date, date)	Produces the number of full weeks between two data elements/attributes of type date. The static date format is 'yyyy-MM-dd'.
d2:monthsBetween	(date, date)	Produces the number of full months between two data elements/attributes of type date. The static date format is 'yyyy-MM-dd'.
d2:yearsBetween	(date, date)	Produces the number of full years between two data elements/attributes of type date. The static date format is 'yyyy-MM-dd'.
d2:condition	(boolean-expr, true-val, false-val)	Evaluates the conditional expression and if true returns the true value, if false returns the false value. The conditional expression must be quoted.
d2:zing	(number)	Evaluates the data element/attribute of type number to zero if the value is negative, otherwise to the value itself.

Function	Arguments	Description
d2:oizp	(number)	Evaluates the data element/attribute of type number to one if the value is zero or positive, otherwise to zero.
d2:zpvc	(object, [,object, object,...])	Returns the number of numeric zero and positive values among the given object arguments. Can be provided any number of arguments.

### Example 19.6.

A filter that uses the "hasValue" function looks like this:

```
d2:hasValue(#{mCXR7u4kNBW.NFkjsNiQ9PH})
```

### Example 19.7.

An expression that uses the "zing" and "oizp" functions looks like this:

```
d2:zing(A{GPkGfbmArby}) + d2:oizp(#{mCXR7u4kNBW.NFkjsNiQ9PH})
```

### Example 19.8.

An expression that uses the "daysBetween" function looks like this:

```
d2:daysBetween(#{mCXR7u4kNBW.k8ja2Aif1Ae}, '2015-06-01')
```

### Example 19.9.

An expression that uses the "condition" function looks like this:

```
d2:condition(' #{mCXR7u4kNBW.NFkjsNiQ9PH} > 100', 150, 50)
```

### Example 19.10.

An expression that uses the "zpvc" function looks like this:

```
d2:zpvc(A{GPkGfbmArby}), #{mCXR7u4kNBW.NFkjsNiQ9PH}), 4, -1)
```

## 19.4.5.2. Variables to use in a program indicator expression or filter

The program indicator expression and filter support a range of variables:

**Table 19.9. Variables to use in a program indicator expression or filter**

Variable	Description
event_date	The date of when the event took place.
due_date	The date of when an event is due.
incident_date	The date of the incidence of the event.
enrollment_date	The date of when the tracked entity instance was enrolled in the program.
enrollment_status	Can be used to include or exclude enrollments in certain statuses.

### Example 19.11.

When calculating the hemoglobin improvement/deterioration throughout a pregnancy, it might make sense to only consider completed enrollments. If non-completed enrollments is not filtered

Variable	Description
	out, these will represent half-finished ANC followups, where the final improvement/deterioration is not yet established.
current_date	The current date.
value_count	The number of non-null values in the expression part of the event.
zero_pos_value_count	The number of numeric positive values in the expression part of the event.
event_count	The count of events (useful in combination with filters).
enrollment_count	The count of enrollments (useful in combination with filters).
tei_count	The count of tracked entity instances (useful in combination with filters).
program_stage_name	Can be used in filters for including only certain program stages in a filter for tracker programs. Uses the name of the program stage:  V{program_stage_name} == 'ANC first visit'
program_stage_id	Can be used in filters for including only certain program stages in a filter for tracker programs. Uses the unique identifier of the program stage:  V{program_stage_id} == 'YPSSfbmAtt1'

### Example 19.12.

An expression that uses the "value count" variable looks like this:

```
(#{A03MvHHogjR.a3kGcGDCuk6} + #{A03MvHHogjR.wQLfBvPrXqq}) / V{value_count}
```

### Example 19.13.

An expression that uses the "event\_date" and "incident\_date" variables looks like this:

```
d2:daysBetween(V{incident_date},V{event_date})
```

#### 19.4.5.3. Operators to use in a program indicator filter

**Table 19.10. Operators to use in a program indicator filter**

Operator	Description
and	Logical AND
or	Logical OR
==	Equal to
!=	Not equal to
<	Less than
<=	Less than or equal to
>	Greater than
>=	Greater than or equal to

These operators can be used to form logical expressions which ultimately evaluate to either true or false. For example you can assert that multiple data elements must be a specific value, or that specific attributes must have numerical values less or greater than a constant.

### Example 19.14.

A filter that uses both attributes and data elements looks like this:

```
A{cejWyOfXge6} == 'Female' and #{A03MvHHogjR.a3kGcGDCuk6} <= 2
```

## Tip

DHIS2 is using the JEXL library for evaluating expressions which supports additional syntax beyond what is covered in this documentation. See the reference at the [project home page](#) to learn how you can create more sophisticated expressions

## 19.5. Configure program rules

### 19.5.1. About program rules

Program rules allows you to create and control dynamic behavior of the user interface in the **Tracker Capture** and **Event Capture** apps. During data entry, the program rules expressions are evaluated each time the user interface is displayed, and each time a data element is changed. Most types of actions will take effect immediately when the user enters values in the **Tracker Capture** and **Event Capture** apps.

**Table 19.11. Program rule components**

Program rule component	Description
Program rule action	Each program rule contains one or multiple actions. These are the behaviors that are triggered in the user interface when the expression is true. Actions will be applied at once if the expression is true, and will be reverted if the expression is no longer true. There are several types of actions and you can have several actions in one program rule.
Program rule expression	Each program rule has a single expression that determines whether the program rule actions should be triggered, if the expression evaluates to true. If the expression is true the program rule is in effect and the actions will be executed. If the expression is false, the program rule is no longer in effect and the actions will no longer be applied.  You create the expression with standard mathematical operators, custom functions, user-defined static values and program rule variables. The program rule variables represent attribute and data element values which will be evaluated as part of the expression.
Program rule variable	Program rule variables lets you include data values and attribute values in program rule expressions. Typically, you'll have to create one or several program rule variables before creating a program rule. This is because program rules expressions usually contain at least one data element or attribute value to be meaningful.

Program rule component	Description
	The program rule variables are shared between all rules in your program. When you create multiple program rules for the same program, these rules will share the same library of program rule variables.

In the **Maintenance** app, you manage the following program rule objects:

Object type	Available functions
Program rule	Create, edit, clone, delete, show details and translate
Program rule variable	Create, edit, clone, share, delete, show details and translate

## 19.5.2. Workflow

1. In the **Maintenance** app, create program rule variable(s) if needed.
2. In the **Maintenance** app, create the program rule:
  - a. Enter the program rule details.
  - b. Create the program rule expression.
  - c. Define the program rule actions.
3. In the **Tracker Capture** or **Event Capture** apps, verify that the program rule behaves as expected.

## 19.5.3. Create or edit a program rule variable

1. Open the **Maintenance** app and click **Program > Program rule variable**.
2. Click the add button.
3. Select a **Program** and enter a **Name**.
4. Select if you want to **Use code for option set**.

This option is only effective when the data element or tracked entity attribute is connected to an option set. If you don't select this option, the program rule variable will be populated with the option set's name. If you select the option, the program rule variable will be populated with the option set's code instead.

5. Select a **Source type** and enter the required information.

Depending on the source type, you'll have to select, for example, a **Program stage**, **Data element** or **Tracked entity attribute**.

The source types determine how the program rule variable is populated with a value.

Source type	Description
<b>Data element from the newest event for a program stage</b>	<p>This source type works the same way as <b>Data element from the newest event in the current program</b>, except that it only evaluates values from one program stage.</p> <p>This source type can be useful in program rules where the same data element is used in several program stages, and a rule needs to evaluate the newest data value from within one specific stage.</p>

Source type	Description
<b>Data element from the newest event in the current program</b>	<p>This source type is used when a program rule variable needs to reflect the newest known value of a data element, regardless of what event the user currently has open.</p> <p>This source type is populated slightly differently in <b>Tracker Capture</b> and <b>Event Capture</b> apps:</p> <p><b>Tracker Capture:</b> the program rule variable will be populated with the newest data value collected for the given data element within the enrollment.</p> <p><b>Event Capture:</b> the program rule variable will be populated with the newest data value found within the 10 newest events in the same organisation unit.</p> <p>The newest data value is determined with event date.</p>
<b>Data element in current event</b>	<p>Program rule variables with this source type will contain the data value from the same event that the user currently has open.</p> <p>This is the most commonly used source type, especially for skip logic (hide actions) and warning/error rules.</p>
<b>Data element from previous event</b>	<p>Program rule variables with this source type will contain the value from a specified data element from a previous event. Only older events are evaluated, not including the event that the user currently has open.</p> <p>This source type is commonly used when a data element only should be collected once during an enrollment, and should be hidden in subsequent events.</p> <p>Another use case is making rules for validating input where there is an expected progression from one event to the next - a rule can evaluate whether the previous value is higher/lower and give a warning if an unexpected value is entered.</p> <p>This source type is populated slightly differently in <b>Tracker Capture</b> and <b>Event Capture</b> apps:</p> <p><b>Tracker Capture:</b> the program rule variable will be populated with the newest data value collected for the given data element within the enrollment - but only</p>

Source type	Description
	<p>evaluating the events that comes before the current event date.</p> <p><b>Event Capture:</b> the program rule variable will be populated with the newest data value collected within the 10 events preceding the current event date - not including the current event.</p> <p>The newest data value is determined with event date.</p>
Calculated value	TBA
<b>Tracked entity attribute</b>	<p>Populates the program rule variable with a specified tracked entity attribute for the current enrollment.</p> <p>Use this is the source type to create program rules that evaluate data values entered during registration.</p> <p>This source type is also useful when you create program rules that compare data in events to data entered during registration.</p> <p>This source type is only used for tracker programs (programs with registration).</p>

6. Click **Save**.

#### 19.5.4. Create or edit a program rule

#### Note

A program rule belongs to exactly one program.

1. Open the **Maintenance** app and click **Program > Program rule**.
2. Click the add button.
3. Enter the program rule details. These fields are not shown to the end user, they are only meant for the program administrator.
  - **Program**
  - **Name**
  - **Description**
  - **Priority**

#### Example 19.15.

Let's say you have 16 program rules in your program. You configure the program rules with the following priority settings:

- Priority 1 for program rule A
- Priority 2 for program rules B - K
- No priority for program rules L - P

Result: the system runs the program rules in the following order:

- a. Program rule A

- b. Program rules B - K (you can't find out or configure in which order the system runs these program rules)
- c. Program rules L - P.
4. Click **Enter program rule expression** and create the program rule expression with the help of variables, functions and operators.
5. Click **Define program rule actions** and create the actions executed when the expression is true.
- a. Click the add button, select an **Action** and enter the required information.

Depending on the action type, you'll have to perform different types of settings. For some action types, you must also enter free text or create expressions.

Action type	Required settings	Description
<b>Assign value</b>	<b>Data element to assign value to</b> <b>Program rule variable to assign value to</b> <b>Expression to evaluate and assign</b>	<p>Used to help the user calculate and fill out fields in the data entry form. The idea is that the user shouldn't have to fill in values that the system can calculate, for example BMI.</p> <p>When a field is assigned a value, the user sees the value but the user can't edit it.</p> <p>Example from Immunization stock card in Zambia: The data element for vaccine stock outgoing balance is calculated based on the data element for incoming stock balance minus the data elements for consumption and wastage.</p> <p>Advanced use: configure an 'assign value' to do a part of a calculation and then assign the result of the calculation to a program rule variable. This is the purpose with the "Calculated value" program rule variable.</p>
<b>Display text</b>	<b>Display widget</b> <b>Static text</b> <b>Expression to evaluate and display after static text</b>	Used to display information that is not an error or a warning, for example feedback to the user. You can also use this action to display important information, for example

Action type	Required settings	Description
		the patient's allergies, to the user.
<b>Display key/value pair</b>	<b>Display widget</b> <b>Key label</b> <b>Expression to evaluate and display as value</b>	Used to display information that is not an error or a warning.  Example: calculate number of weeks and days in a pregnancy and display it in the format the clinician is used to see it in. The calculation is based on previous recorded data.
<b>Error on complete</b>	<b>Data element to display error next to</b> <b>Tracked entity attribute to display error next to</b> <b>Static text</b> <b>Expression to evaluate and display after static text</b>	Used whenever you've cross-consistencies in the form that must be strictly adhered to. This action prevents the user from continuing until the error is resolved.  This action differs from the regular <b>Show error</b> since the error is not shown until the user tries to actually complete the form.  If you don't select a data element or a tracked entity attribute to display the error next to, make sure you write a comprehensive error message that helps the user to fix the error.
<b>Hide field</b>	<b>Data element to hide</b> <b>Tracked entity attribute to hide</b> <b>Custom message for blanked field</b>	Used when you want to hide a field from the user.  <b>Custom message for blanked field</b> allows you to define a custom message displayed to the user in case the program rule hides and blanks out the field after the user typed in or selected a value.  If a hide field action hides a field that contains a value, the field will always removed. If no message is defined, a standard message will be displayed to alert the user.

Action type	Required settings	Description
<b>Hide section</b>	<b>Program stage section to hide</b>	TBA
<b>Hide program stage</b>	<b>Program stage to hide</b>	Used when you want to hide a program stage section from the user.
<b>Make field mandatory</b>	<b>Data element to make mandatory</b>  <b>Tracked entity attribute to make mandatory</b>	TBA
<b>Show error</b>	<b>Data element to display error next to</b>  <b>Tracked entity attribute to display error next to</b>  <b>Static text</b>  <b>Expression to evaluate and display after static text</b>	<p>Used whenever there are rules which must strictly be adhered to. The show error action prevents the user from continuing until the error is resolved.</p> <p>Such a strict validation should only be used when it's certain that the evaluated expression is never true unless the user has made a mistake in data entry.</p> <p>It's mandatory to define a message that is shown to the user when the expression is true and the action is triggered.</p> <p>You can select which data element or tracked entity attribute to link the error to. This will help the user to fix the error.</p> <p>In case several data elements or attributes are involved, select the one that is most likely that the user would need to change.</p>
<b>Show warning</b>	<b>Data element to display warning next to</b>  <b>Tracked entity attribute to display warning next to</b>  <b>Static text</b>  <b>Expression to evaluate and display after static text</b>	<p>Used to give the user a warning about the entered data, but at the same time to allow the user to save and continue.</p> <p>You can use warnings to help the user avoid errors in the entered data, while at the same time allow the user to consciously disregard the</p>

Action type	Required settings	Description
		<p>warnings and save a value that is outside preset expectations.</p> <p><b>Static text</b> defines the message shown to the user when the expression is true and the action is triggered.</p> <p>You can select which data element or tracked entity attribute to link the error to. This will help the user to fix the error.</p> <p>In case several data elements or attributes are involved, select the one that is most likely that the user would need to change.</p>
<b>Warning on complete</b>	<p><b>Data element to display warning next to</b></p> <p><b>Tracked entity attribute to display warning next to</b></p> <p><b>Static text</b></p> <p><b>Expression to evaluate and display after static text</b></p>	<p>Used to give the user a warning if he/she tries to complete inconsistent data, but at the same time to allow the user to continue. The warning is shown in a dialog when the user completes the form.</p> <p><b>Static text</b> defines the message shown to the user when the expression is true and the action is triggered. This field is mandatory.</p> <p>You can select which data element or tracked entity attribute to link the error to. This will help the user to fix the error.</p> <p>If you don't select a data element or a tracked entity attribute to display the error next to, make sure you write a comprehensive error message that helps the user to fix the error.</p>

- b. Click **Save**.
- c. (Optional) Repeat above steps to add more actions.

6. Click **Save**.

### 19.5.5. Example: Program rules

#### Note

You can view all examples on the demo server: <https://play.dhis2.org/dev/dhis-web-maintenance/#/list/programSection/programRule>

#### Example 19.16. Display key/value pair

This example shows how to configure a program rule which calculate number of weeks and days in a pregnancy and display the result in the format the clinician is used to see it in. The calculation is based on previous recorded data.

##### 1. Program rule details

Program rule

① Enter program rule details      ② Enter program rule expression      ③ Define program rule actions

Program (\*)  
WHO RMNCH Tracker

Name (\*)  
Show current gestational age (w+d)

Description  
Show current gestational age(in weeks+days) if the current pregnancy does not already have an outcome, and the current gestational age would not be over 50.

Priority

**SAVE**    **CANCEL**

##### 2. Program rule expression

Program rule

① Enter program rule details      ② Enter program rule expression      ③ Define program rule actions

Expression  
!d2:hasValue('currentPregnancyOutcome') && d2:hasValue('lmp') && d2:weeksBetween(#lmp,V{current\_date}) < 50

Operators:  
+, -, \*, /, %  
>, >=, <, <=, ==, !=  
NOT, AND, OR

Variables  
#allergies  
#autoimmunedisease  
#born  
#(chronicconditions)  
#(chronichypertension)  
#{currentPregnancyOutcome}  
#(diabetes)  
#(diastolicbloodpressure)

Functions

**SAVE**    **CANCEL**

### 3. Program rule action

Define program rule action

Action (\*)  
Display key/value pair

Location (\*)  
Program indicator widget

Content (\*)  
Gest. age

Data  
d2:concatenate(d2:weeksBetween(\${lmp}, V{current\_date}), '+', d2:modulus(d2:daysBetween(\${lmp}, \

CANCEL      **SAVE**

The full expression in the **Data** field:

```
d2:concatenate(d2:weeksBetween(${lmp}, V{current_date}), '+',
d2:modulus(d2:daysBetween(${lmp}, V{current_date}), 7))
```

### Result of program rule in Tracker Capture or Event Capture apps:

### Example 19.17. Show display text in Feedback widget

This example shows how to configure a program rule to display text in the Feedback widget in the **Tracker Capture** app.

#### 1. Program rule variable

dhis2 DHIS 2 Demo - Sierra Leone

ALL CATEGORY DATA ELEMENT DATA SET INDICATOR ORGANISATION UNIT PROGRAM VALIDATION OTHER

Program rule variable

Program (\*)  
WHO RMNCH Tracker

Name (\*)  
**penicillinAllergy**

Code

Source type (\*)  
Data element from the newest event in the current program

Data element  
WHOMCH Penicillin allergy

Tracked entity attribute

Use code for option set

Program Stage

**SAVE**      **CANCEL**

## 2. Program rule details

Program rule

① Enter program rule details      ② Enter program rule expression      ③ Define program rule actions

Program (\*)  
WHO RMNCH Tracker

Name (\*)  
Show feedback if woman is registered with penicillin allergy

Description  
Show a warning in the feedback widget if the woman has penicillin allergy

Priority

**SAVE**    CANCEL

## 3. Program rule expression

Program rule

① Enter program rule details      ② Enter program rule expression      ③ Define program rule actions

Expression  
#{penicillinAllergy} == 'Yes'

Operators:  
+   -   \*   /   %  
>   >=   <   <=   ==   !=  
NOT   AND   OR

Variables  
#{allergies}  
#{autoimmunedisease}  
#{born}  
#{chronicconditions}  
#{chronichypertension}  
#{currentPregnancyOutcome}  
#{diabetes}  
#{diastolicbloodpressure}

Functions

**SAVE**    CANCEL

## 4. Program rule action

Define program rule action

Action (\*)  
Display text

Location (\*)  
Feedback widget

Content (\*)  
Penicillin allergy

Data

CANCEL    **SAVE**

## Result of program rule in Tracker Capture or Event Capture apps:

The screenshot shows the DHIS2 interface with the title "dhis2 DHIS 2 Demo - Sierra Leone". On the left, there is a form with various input fields for medical history. On the right, there is a "Feedback" widget containing the text "Penicillin allergy", which is highlighted with a yellow box. Below the feedback widget, there is a "Profile | Edit" section with fields for "Unique ID" (9191132445122) and "First name" (Ava).

### Example 19.18. Show information from first program stage in Feedback widget

This example shows how to configure a program rule to always display certain data in the Feedback widget in the **Tracker Capture** app. This is useful when you want to make sure that vital data, for example medicine allergies, is always visible.

#### 1. Program rule variable

The screenshot shows the DHIS2 interface with the title "dhis2 DHIS 2 Demo - Sierra Leone". The "PROGRAM" tab is selected. A "Program rule variable" is being configured for the "WHO RMNCH Tracker" program. The "Name" field contains the value "othermedicineallergyexists", which is highlighted with a yellow box. The "Code" field is empty. The "Source type" is set to "Data element from the newest event in the current program". The "Data element" is "WHOMCH Other medicine allergy". At the bottom, there are "SAVE" and "CANCEL" buttons.

#### 2. Program rule details

The screenshot shows the DHIS2 interface with the title "dhis2 DHIS 2 Demo - Sierra Leone". The "PROGRAM" tab is selected. A "Program rule" is being configured for the "WHO RMNCH Tracker" program. The "Name" field contains the value "Show feedback if the woman is registered with medicine allergy". The "Description" field contains the text "If the woman is registered with any medicine allergy, show info in the feedback widget, including the name of the allergy.". The "Priority" field is empty. At the bottom, there are "SAVE" and "CANCEL" buttons.

### 3. Program rule expression

Program rule

① Enter program rule details

② Enter program rule expression

③ Define program rule actions

Expression

```
#{{othermedicineallergyexists}} == 'Yes'
```

Operators:

+	-	*	/	%		
>	>=	<	<=	==	!=	
NOT	AND	OR				

Variables

- #(allergies)
- #(autoimmunedisease)
- #(born)
- #(chronicconditions)
- #(chronichypertension)
- #(currentProgramancyOutcome)
- #(diabetes)
- #(diastolicbloodpressure)

Functions

SAVE CANCEL

### 4. Program rule action

Define program rule action

Action (\*)

Display text

Location (\*)

Feedback widget

Content (\*)

Medicine allergy:

Data

```
#{{othermedicineallergy}}
```

CANCEL SAVE

## Medicine allergies recorded in first program stage in the Tracker Capture app:

The screenshot shows the DHIS2 interface for the 'dhis2' demo. On the left, under 'Pre-existing conditions', there are several questions with radio button options ('Yes' or 'No'). Some fields are highlighted in green, such as 'A: Other medicine allergy specified' (Paracetamol) and 'Feedback' entries. On the right, a 'Profile | Edit' section shows a unique ID (9191132445122), first name (Ava), last name (Didriksson), and email address. A yellow box highlights the 'Feedback' section, which contains entries for 'Penicillin allergy' and 'Medicine allergy: Paracetamol'.

## Result of program rule in the Tracker Capture app:

The screenshot shows the DHIS2 interface for the 'WHO RMNCH Tracker' program. On the left, the 'Enrollment' screen displays the selected program (Ngelelun CHC) and date of first visit (2017-10-14). Below it, the 'Timeline Data Entry' screen shows a sequence of events: '2017-10-06 Ngelelun CHC Previous deliveries (Open)' followed by '2017-10-14 Ngelelun CHC First antenatal care visit (Open)'. On the right, a 'Profile | Edit' section shows the same profile information as the previous screenshot. A yellow box highlights the 'Feedback' section, which contains the same entries as the previous screenshot: 'Penicillin allergy' and 'Medicine allergy: Paracetamol'.

## Example 19.19. Calculate gestational age in weeks at visit

By using a program rule of type "Assign value" you can calculate the "Gestational age at visit" value and fill it in the data entry form. You configure the program rule to calculate "Gestational age at visit" based on either "LMP date" or "Ultrasound estimated due date".

## 1. Program rule details

Program rule

① Enter program rule details    ② Enter program rule expression    ③ Define program rule actions

Program (\*)  
WHO RMNCH Tracker

Name (\*)  
Calculate gestational age from LMP

Description  
Calculates the gestational age in weeks from the LMP date

Priority  
1

**SAVE**   **CANCEL**

## 2. Program rule expression

Program rule

① Enter program rule details    ② Enter program rule expression    ③ Define program rule actions

Expression  
d2:hasValue('lmp')

Operators:

+	-	*	/	%
>	>=	<	<=	==
!=	NOT	AND	OR	

Variables

- #(allergies)
- #(autoimmunedisease)
- #(born)
- #(chronicconditions)
- #(chronichypertension)
- #(currentProgranancyOutcome)
- #(diabetes)
- #(diastolicbloodpressure)

Functions

**SAVE**   **CANCEL**

## 3. Program rule action

Define program rule action

Action (\*): Assign value

Data element  
WHOMCH Gestational age in weeks at visit

Program rule variable

Data (\*): d2:weeksBetween(#{lmp},V{event\_date})

**CANCEL**   **SAVE**

## Result of program rule in Tracker Capture or Event Capture apps:

### 19.5.6. Reference information: Operators and functions to use in program rule expression

#### Tip

You can nest functions within each other and with subexpressions to form more complex conditions. An example that produces the gestational age in weeks, based on last menstrual date:

```
d2:floor( d2:daysBetween(#{lastMenstrualDate},v{event_date}) / 7 )
```

#### Tip

The source type will determine how the d2: function calls will evaluate a (sourcefield) parameter.

Example: where #{hemoglobinCurrent} is set to source type **Data element in current event**. The following function call will evaluate whether hemoglobin is entered in the current event.

```
d2:hasValue( 'hemoglobinCurrent' )
```

Example: where #{hemoglobin} is set to source type **Data element from the newest event in the current program**. The following function call will evaluate whether there exists a value for the hemoglobin in any event in the enrollment.

```
d2:hasValue( 'hemoglobin' )
```

**Example:** where `#{{hemoglobinPrevious}}` is set to source type **Data element from previous event**. The following function call will evaluate whether there exists a value for the hemoglobin among the events preceding the current event.

```
d2:hasValue( 'hemoglobinPrevious' )
```

**Table 19.12. Possible operators to use in a program rule expression**

Operator	Description
+	Add numbers together
-	Subtract numbers from each other
*	Multiply two numbers
/	Divide two numbers
%	The modulus of two numbers
&&	Logical AND. True only when the expression on the left and right side is true. The left and right side can be yes/no, yes only or a subexpression in parenthesis.
	Logical OR. True when either the expression on the left or the expression on the right side is true. The left and right side can be yes/no, yes only or a subexpression in parenthesis.
>	Left number greater than right number
>=	Left number greater than or equal to right number
<	Left number less than right number
<=	Left number less than or equal to right number.
==	Left side equal to right side. Supports numbers, text, yes/no and yes only.
!=	Left side not equal to right side. Supports numbers, text, yes/no and yes only.
!	Negates the following value. Can be used for yes/no, yes only or a sub-expression in parenthesis.
()	Parenthesis is used to group sub-expressions.

**Table 19.13. Custom functions to use in a program rule expression**

Function	Arguments	Description
d2:ceil	(number)	<p>Rounds the input argument <b>up</b> to the nearest whole number.</p> <p>Example:</p> <pre>d2:ceil(#{{hemoglobinValue}})</pre>
d2:floor	(number)	<p>Rounds the input argument <b>down</b> to the nearest whole number.</p> <p>An example producing the number of weeks the woman is pregnant. Notice that the subexpression <code>#{{gestationalAgeDays}}/7</code> is evaluated before the floor function is executed:</p> <pre>d2:floor(#{{gestationalAgeDays}}/7)</pre>
d2:round	(number)	Rounds the input argument to the nearest whole number.

Function	Arguments	Description
d2:modulus	(number,number)	<p>Produces the modulus when dividing the first with the second argument.</p> <p>An example producing the number of days the woman is into her current pregnancy week:</p> <pre>d2:modulus(\${gestationalAgeDays}, 7)</pre>
d2:zing	(number)	Evaluates the argument of type number to zero if the value is negative, otherwise to the value itself.
d2:oizp	(number)	Evaluates the argument of type number to one if the value is zero or positive, otherwise to zero.
d2:concatenate	(object, [,object, object,...])	Produces a string concatenated string from the input parameters. Supports any number of parameters. Will mainly be in use in future action types, for example to display gestational age with d2:concatenate('weeks','+', 'gestationalageDays').
d2:daysBetween	(date, date)	<p>Produces the number of days between the first and second argument. If the second argument date is before the first argument the return value will be the negative number of days between the two dates. The static date format is 'yyyy-MM-dd'.</p> <p>Example, calculating the gestational age(in days) of a woman, based on the last menstrual period and the current event date:</p> <pre>d2:daysBetween(\${lastMenstrualDate}, \${event_date})</pre>
d2:weeksBetween	(date, date)	Produces the number of full weeks between the first and second argument. If the second argument date is before the first argument the return value will be the negative number of weeks between the two dates. The static date format is 'yyyy-MM-dd'.
d2:monthsBetween	(date, date)	Produces the number of full months between the first and second argument. If the second argument date is before the first argument the return value will be the negative number of months between the two dates. The static date format is 'yyyy-MM-dd'.
d2:yearsBetween	(date, date)	Produces the number of years between the first and second argument. If the second argument date is before the first argument the return value will be the negative number of years between the two dates. The static date format is 'yyyy-MM-dd'.
d2:addDays	(date, number)	Produces a date based on the first argument date, adding the second argument number of days.

Function	Arguments	Description
		<p>An example calculating the pregnancy due date based on the last menstrual period:</p> <pre>d2:addDays(#{lastMenstrualDate}, 283)</pre>
d2:count	(sourcefield)	<p>Counts the number of values that is entered for the source field in the argument. The source field parameter is the name of one of the defined source fields in the program - see example</p> <p>Example usage where # {previousPregnancyOutcome} is one of the source fields in a repeatable program stage "previous pregnancy":</p> <pre>d2:count('previousPregnancyOutcome')</pre>
d2:countIfValue	(sourcefield, text)	<p>Counts the number of matching values that is entered for the source field in the first argument. Only occurrences that matches the second argument is counted. The source field parameter is the name of one of the defined source fields in the program - see example.</p> <p>Example usage where # {previousPregnancyOutcome} is one of the source fields in a repeatable program stage "previous pregnancy". The following function will produce the number of previous pregnancies that ended with abortion:</p> <pre>d2:countIfValue('previousPregnancyOutcome', 'Abortion')</pre>
d2:countIfZero	(sourcefield)	<p>Counts the number of values that is zero or positive entered for the source field in the argument. The source field parameter is the name of one of the defined source fields in the program - see example.</p> <p>Example usage where # {fundalHeightDiscrepancy} is one of the source fields in program, and it can be either positive or negative. The following function will produce the number of positive occurrences:</p> <pre>d2:countIfZeroPos('fundalHeightDiscrepancy')</pre>
d2:hasValue	(sourcefield)	<p>Evaluates to true if the argument source field contains a value, false if no value is entered.</p> <p>Example usage, to find if the source field # {currentPregnancyOutcome} is yet filled in:</p> <pre>d2:hasValue('currentPregnancyOutcome')</pre>
d2:zpvc	(object, [,object, object,...])	Returns the number of numeric zero and positive values among the given object

Function	Arguments	Description
		arguments. Can be provided with any number of arguments.
d2:validatePattern	(text, regex-pattern)	<p>Evaluates to true if the input text is an exact match with the supplied regular expression pattern. The regular expression needs to be escaped.</p> <p>Example expression, triggering actions if a number is not on the pattern 9999/99/9:</p> <pre>!d2:validatePattern(A{nrc}, '\d{6}\/\d{2}\/\d')</pre> <p>Example expression, triggering actions that if the address is not consisting of letters or white spaces, then a white space, then a number:</p> <pre>! d2:validatePattern(A{registrationAddress}, '[\w ]+ \d+')</pre> <p>Example, triggering actions if a name contains any numbers:</p> <pre>!d2:validatePattern(A{name}, '[^\d]*')</pre> <p>Example expression, triggering actions if a mobile number contains the illegal number sequence 555:</p> <pre>d2:validatePattern(A{mobile} , '.*555.*')</pre>
d2:left	(text, num-chars)	<p>Evaluates to the left part of a text, num-chars from the first character.</p> <p>The text can be quoted or evaluated from a variable:</p> <pre>d2:left(\${variableWithText}, 3)</pre>
d2:right	(text, num-chars)	<p>Evaluates to the right part of a text, num-chars from the last character.</p> <p>The text can be quoted or evaluated from a variable:</p> <pre>d2:right(\${variableWithText}, 2)</pre>
d2:substring	(text, start-char-num, end-char-num)	<p>Evaluates to the part of a string specified by the start and end character number.</p> <p>The text can be quoted or evaluated from a variable:</p> <pre>d2:right(\${variableWithText}, 2, 4)</pre>
d2:split	(text, delimiter, element-num)	<p>Split the text by delimiter, and keep the nth element(0 is the first).</p> <p>The text can be quoted or evaluated from a variable, the delimiter must be quoted:</p> <pre>d2:split(\${variableWithText}, '-', 1)</pre>

Function	Arguments	Description
		Note: comma delimiter(,) is not supported.
d2:length	(text)	<p>Find the length of a string. Example: <code>d2:length(\${variableWithText})</code></p>

## 19.6. Configure relationship types

### 19.6.1. About relationship types

A relationship type defines the relationship between tracked entity A and tracked entity B, for example mother and child.

### 19.6.2. Create or edit a relationship type

1. Open the **Maintenance** app and click **Program > Relationship type**.
2. Click the add button.
3. Type a **Name** of the relationship type.
4. (Optional) Assign a **Code**.
5. In the **A is to B** field, enter a description of which relationship tracked entity A has to tracked entity B, for example mother.
6. In the **B is to A** field, enter a description of which relationship tracked entity B has to tracked entity A, for example child.
7. Click **Save**.

## 19.7. Configure tracked entities

### 19.7.1. About tracked entities

A tracked entity is a types of entities which can be tracked through the system. It can be anything from persons to commodities, for example a medicine or a person.

A program must have one tracked entity. To enrol a tracked entity instance into a program, the tracked entity of an entity and tracked entity of a program must be the same.

Tracked entity attributes are used to register extra information for a tracked entity. Tracked entity attributes can be shared between programs.

### 19.7.2. Create or edit a tracked entity attribute

1. Open the **Maintenance** app and click **Program > Tracked entity attribute**.
2. Click the add button.
3. In the **Name** field, type the tracked entity attribute name.
4. (Optional) Type a **Short name**.
5. (Optional) In the **Code** field, assign a code.

6. (Optional) Type a **Description**.

7. Select an **Option set**.

8. In the **Value type** field, select the type of data that the tracked entity attribute will record.

**Table 19.14. Value types**

<b>Value type</b>	<b>Description</b>
Age	-
Coordinate	A point coordinate specified as longitude and latitude in decimal degrees. All coordinate should be specified in the format "-19.23 , 56.42" with a comma separating the longitude and latitude.
Date	Dates render as calendar widget in data entry.
Date & time	-
E-mail	-
File	A file resource where you can store external files, for example documents and photos.
Integer	Any whole number (positive and negative), including zero.
Letter	-
Long text	Textual value. Renders as text area in forms.
Negative integer	Any whole number less than (but not including) zero.
Number	Any real numeric value with a single decimal point. Thousands separators and scientific notation is not supported.
Percentage	Whole numbers inclusive between 0 and 100.
Phone number	
Positive integer	Any whole number greater than (but not including) zero.
Positive of zero integer	Any positive whole number, including zero.
Organisation unit	-
Unit interval	Any real number greater than or equal to 0 and less than or equal to 1.
Text	Textual value. The maximum number of allowed characters per value is 50,000.
Time	Time is stored in HH:mm format. HH is a number between 0 and 23 mm is a number between 00 and 59
Tracker associate	-

Value type	Description
Username	This will be populated with the username of the user which performs data entry automatically during the data entry process.
Yes/No	Boolean values, renders as drop-down lists in data entry.
Yes only	True values, renders as check-boxes in data entry.

9. Select an **Aggregation type**.

**Table 19.15. Aggregation operators**

Aggregation operator	Description
Average	Average the values in both the period as and the organisation unit dimensions.
Average (sum in organisation unit hierarchy)	Average of data values in the period dimension, sum in the organisation unit dimensions.
Count	Count of data values.
Min	Minimum of data values.
Max	Maximum of data values.
None	No aggregation is performed in any dimension.
Sum	Sum of data values in the period and organisation unit dimension.
Standard deviation	Standard deviation (population-based) of data values.
Variance	Variance (population-based) of data values.

10Select **Unique** to specify that the values of the tracked entity attribute is unique.

There are two options for the unique setting:

- **Entire system:** The values of the tracked entity attribute can duplicate with values which belong to other tracked entity attributes. But the values in this tracked entity attribute must not duplicate.

Select **Automatically generated** to allow automatic generation of the tracked entity attribute value. When the generate setting is selected on, an optional field for specifying pattern also displays. Enter an amount of numbers into this field equal to the ciphers you want in the generated value. A pattern of 0000 would result in a generated value above 1000 and below 9999. The number of ciphers should at least allow 20 % more values than you expect is needed for keeping the ID unique.

- **Organisation unit:** The values of the tracked entity attribute must not duplicate in the same organisation unit.

11Select **Inherit** to registry a new entity for relationship with an available entity, all inherit entity attribute values of the entity will be pre-filled in the registration form.

12(Optional) Select **Confidential**.

This option is only available if you have configured encryption for the system.

13(Optional) Select **Display in list without program**.

14(Optional) Assign one or multiple **Legends**.

15Click **Save**.

### 19.7.3. Create or edit a tracked entity

1. Open the **Maintenance** app and click **Program > Tracked entity**.
2. Click the add button.
3. Type a **Name** of the tracked entity.
4. (Optional) Enter a **Description** of the tracked entity.
5. (Optional) Enter an **Alternative name** of the tracked entity.
6. Click **Save**.

## 19.8. Clone metadata objects

Cloning a data element or other objects can save time when you create many similar objects.

1. Open the **Maintenance** app and find the type of metadata object you want to clone.
2. In the object list, click the options menu and select **Clone**.
3. Modify the options you want.
4. Click **Save**.

## 19.9. Delete metadata objects

### Note

You can only delete a data element and other data element objects if no data is associated to the data element itself.

### Warning

Any data set that you delete from the system is irrevocably lost. All data entry forms, and section forms which may have been developed will also be removed. Make sure that you have made a backup of your database before deleting any data set in case you need to restore it at some point in time.

1. Open the **Maintenance** app and find the type of metadata object you want to delete.
2. In the object list, click the options menu and select **Delete**.
3. Click **Confirm**.

## 19.10. Change sharing settings for metadata objects

You can assign different sharing settings to metadata objects, for example organisation units and tracked entity attributes. These sharing settings control which users and users groups that can view or edit a metadata object.

### Note

The default setting is that everyone (**Public access**) can find, view and edit metadata objects.

1. Open the **Maintenance** app and find the type of metadata object you want to modify.
2. In the object list, click the options menu and select **Sharing settings**.

3. (Optional) Add users or user groups: search for a user or a user group and select it. The user group is added to the list.
4. Change sharing settings for the users and user groups you want to modify.
  - **Can edit and view:** Everyone can view and edit the object.
  - **Can view only:** Everyone can view the object.
  - **No access:** The public won't have access to the object. This setting is only applicable to **Public access**.
5. Click **Close**.

## 19.11. Display details of metadata objects

1. Open the **Maintenance** app and find the type of metadata object you want to view.
2. In the object list, click the options menu and select **Show details**.

## 19.12. Translate metadata objects

DHIS2 provides functionality for translations of database content, for example data elements, data element groups, indicators, indicator groups or organisation units. You can translate these elements to any number of locales. A locale represents a specific geographical, political, or cultural region.

### Tip

To activate a translation, open the **System Settings** app, click > **Appearance** and select a language.

1. Open the **Maintenance** app and find the type of metadata object you want to translate.
2. In the object list, click the options menu and select **Translate**.

### Tip

If you want to translate an organisation unit level, click directly on the **Translate** icon next to each list item.

3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

# Chapter 20. Configure programs in the Programs/Attributes app (legacy app)

## Changes in how you configure programs from version 2.27

- You create program indicators and program rules in the **Maintenance** app. It's no longer possible to create program indicators and program rules in the legacy **Program / Attributes** app.
- You can create event programs (programs without registration) in the **Maintenance** app. The old version of this functionality is also available in the legacy **Program / Attributes** app.

### 20.1. About programs

There are three type of programs:

- Multi events with registration program (MEWR):

Used for programs with many stages, for example Mother Health Program with stages such as ANC Visit (2-4+), Delivery, PNC Visit.

- Single event with registration program (SEWR):

Used for birth certificate and death certificate. This type of programs have only one stage. An TEI just can enroll into the program one time.

- Single event without registration program (anonymous program or SEWoR):

Used for saving health cases without registering any information into the system. This type of programs have only one stage.

A program must be specified with only one tracked entity. Only tracked entity as same as the tracked entity of program can enroll into that program.

A program needs several types of metadata that you create in the **Program / Attributes** and **Maintenance** apps.

**Table 20.1. Program metadata objects in the Program / Attributes app**

Object type	Description	Available functions
Program	A program consist of program stages.	Create, edit, share, delete, assign to organisation units, show details and translate
Program stage	A program stage defines which actions should be taken at each stage.	Create, edit, change sort order, delete, show details and translate
Program stage section	N/A	Create, edit, change sort order, delete, show details and translate
Program indicator group	A group of program indicators	Create, edit, delete, show details and translate
Validation rule	A validation rule is based on an expression which defines	Create, edit and delete

Object type	Description	Available functions
	a relationship between data element values.	
Program notification	Automated message reminder  Set reminders to be automatically sent to enrolled tracked entity instances before scheduled appointments and after missed visits.	Create, edit and delete
Program stage notification	-	Create, edit and delete
Design custom registration form	-	-

**Table 20.2. Program metadata objects in the Maintenance app**

Object type	Description	Available functions
Event program	A single event without registration program	Create, edit, share, delete, show details and translate
Program indicator	An expression based on data elements and attributes of tracked entities which can be used to calculate values based on a formula.	Create, edit, share, delete, show details and translate
Program rule	Allows you to create and control dynamic behavior of the user interface in the <b>Tracker Capture</b> and <b>Event Capture</b> apps.	Create, edit, delete, show details and translate
Relationship type	Defines the relationship between tracked entity A and tracked entity B, for example mother and child.	Create, edit, clone, delete, show details and translate
Tracked entity	Types of entities which can be tracked through the system. Can be anything from persons to commodities, for example a medicine or a person.  A program must have one tracked entity. And entity registered must be specified an tracked entity. To enrol a tracked entity instance into a program, the tracked entity of an entity and tracked entity of a program must be the same.	Create, edit, clone, delete, show details and translate
Tracked entity attribute	Used to register extra information for a tracked entity.	Create, edit, clone, share, delete, show details and translate

Object type	Description	Available functions
	Can be shared between programs.	

To learn how you create program metadata in the Maintenance app, see [Configure programs in the Maintenance app](#)

## 20.2. Manage programs

### 20.2.1. Create a program

1. Open the **Program / Attributes** app and click **Program**.
2. Click **Add new**.
3. Enter program details:
  - a. Enter a program **Name**.
  - b. Enter a **Short name**.
  - c. Enter a **Description** of the program.
  - d. Select a **Type**.
  - e. Select a **Tracked entity**.
  - f. Select a **Combination of categories**.
  - g. Select a **Data approval workflow**.
  - h. Select if you want to **Display front page list**.
  - i. Select if **First stage appears on registration page**.
  - j. Enter number of **Completed events expiry days**.

Defines the number of days for which you can edit a completed event. This means that when an event is completed and the specified number of expiry days has passed, the event is locked.

#### Example 20.1.

If you set "Completed events expiry days" to 10", an event is locked ten days after the completion date. After this date you can no longer edit the event.

- k. Select an **Expiry period type** and enter number of **Expiry days**.

The expiry days defines for how many days after the end of the previous period, an event can be edited. The period type is defined by the expiry period type. This means that when the specified number of expiry days has passed since the end date of the previous period, the events from that period are locked.

#### Example 20.2.

If you set the expiry type to "Monthly" and the expiry days to "10" and the month is October, then you can't add or edit an event to October after the 10th of November.

4. Enter enrollment details:
  - a. Select if you want to **Allow future enrollment dates**.
  - b. Select if you want to **Allow future incident dates**.
  - c. If you want a tracked entity to be able to enroll only once in a program, select **Only enroll once (per tracked entity instance lifetime)**

This setting is useful for example in child vaccination or post-mortem examination programs where it wouldn't make sense to enroll a tracked entity more than once.

d. Select if you want to **Show incident date**.

This setting allows you to show or hide the incident date field when a tracked entity enrolls in the program.

e. Enter a **Description of incident date**.

**Example 20.3.**

- In an immunization program for child under 1 year old, the incident date is the child's birthday,
- In a maternal program, the incident date is the date of last menstrual period.

f. Enter a **Description of enrollment date**.

**Example 20.4.**

The date when a tracked entity is registered to the system.

g. Select if you want to **Capture coordinates**.

5. Enter relationship shortcut details:

a. Select a **Relationship** type.

**Example 20.5.**

When a baby is born, you can register the baby and enroll him/her into the Child program from the "Delivery" event of the mother. After that, create a relationship as Mother/Child for this mother and the baby.

b. Enter a **Shortcut link label**.

The shortcut link label is displayed in Relation tab in the tracked entity instance (TEI) dashboard.

c. Select **Who is the new relative to the existing entity?**.

d. Select the **Program for new relative to be enrolled in**.

Specify a program that new relatives of the tracked entity will be enrolled in

6. Select if you want to **Skip generation of events that are overdue (before enrollment date)**.

When a tracked entity enrolls into the program, the events corresponding to the program stages are created. If you select this field, the system will not generate overdue events.

7. Assign tracked entity attributes.

a. In the list of **Available attributes**, double-click the attributes you want to assign to the program.

b. For each assigned attribute, review the settings. You can select:

- Display in list

This is the required field. Verify that at least one attribute has this property.

- Mandatory

- Date in future

8. Click **Add**.

## 20.2.2. Assign a program to organisation units

1. Open the **Program / Attributes** app and click **Program**.

2. Click the program you want to modify and select **Assign program to organisation units**.

248 3. Select organisation units.

- 
4. Click **Save**.

### 20.2.3. Edit programs

1. Open the **Program / Attributes** app and click **Program**.
2. Click the program you want to modify and select **Edit**.
3. Modify the options you want.
4. Click **Update**.

### 20.2.4. Change sharing settings for programs

To set the authority for sharing a program:

1. Open the **Program / Attributes** app and click **Program**.
2. Click the program you want to modify and select **Sharing settings**.
3. (Optional) Add a user group:
  - a. Search for a user group and select it.
  - b. Click the plus icon.

The user group is added to the list.
4. (Optional) If you want to allow external access, select **External access (without login)**.
5. Change the settings for the user groups you want to modify.
  - **None**: The program is private. Only the user who created it can see and use it.
  - **Can view**: Everyone in the user group can view the program.
  - **Can edit and view**: Everyone in the user group can view and edit the program.
6. Click **Save**.

### 20.2.5. Delete programs

1. Open the **Program / Attributes** app and click **Program**.
2. Click the relevant program and select **Remove**.
3. Click **OK** to confirm.

### 20.2.6. Display programs

1. Open the **Program / Attributes** app and click **Program**.
2. Click the relevant program and select **Show details**.

### 20.2.7. Translate program names

1. Open the **Program / Attributes** app and click **Program**.
2. Click the relevant program and select **Translate**.
3. Select a locale.
4. Type a **Name**, **Short name** and **Description**.
5. Click **Save**.

## 20.3. Manage program stages

### 20.3.1. About program stages

A program consist of program stages. A program stage defines which actions should be taken at each stage.

### 20.3.2. Create a program stage

1. Open the **Program / Attributes** app and click **Program**.
2. Click the program you want to add a program stage to and select **View program stages**.  
A list of existing stages for the selected program opens. If the program doesn't have any program stages, the list is empty.
3. Click **Add new**.
4. Enter program stage details:
  - a. Enter a **Name**.
  - b. Enter a **Description**.
  - c. In the **Scheduled days from start** field, enter the minimum number of days to wait for starting the program stage.
5. Enter repeatable program stage details.
  - a. Specify if the program stage is **Repeatable** or not.
  - b. Select a **Period type**.
  - c. Enter **Standard interval days**.
 

The number of days to repeat the repeatable program stage.
- d. Clear **Display generate event box after completed** if you don't want to display *Create new event box* to create new event for a repeatable stage after you click *Complete* for an event of the stage in data entry form. This field is select by default.

6. Enter form details.

**Table 20.3.**

Option	Action
<b>Auto-generate event</b>	Clear check box to prevent creating an event of this program stage automatically when a entity enroll in the program.
<b>Open data entry form after enrollment</b>	Select check box to automatically open the event of this stage as soon as the entity has enrolled into the program.
<b>Report date to use</b>	If you have selected the <b>Open data entry form after enrollment</b> check box, also select a <b>Report date to use: Date of incident</b> or <b>Date of enrollment</b> .  This is the date used as report date for an event that has been opened automatically.  If the <b>Report date to use</b> is selected as one of those two ('incident date'/'enrollment date'), in Dashboard, the 'Report date' of the event will be set as one of those two.

Option	Action
<b>Block entry form after completed</b>	Select check box to block the entry form after completion of the event of this stage.  This means that the data in the entry form can't be changed until you reset the status to incomplete.
<b>Ask user to complete program when stage is completed</b>	Select check box to trigger a pop-up which asks the user if he/she wants to create the event of next stage.
<b>Ask user to create new event when stage is complete</b>	Select check box to trigger a pop-up which asks the users if he/she wants to create a new event of this stage when an event of this stage is completed.  This property is active only if you have selected <b>Repeatable</b> .
<b>Generate events by enrollment date</b>	Check on it for auto-generating due dates of events from program-stages of this program based on the enrollment date. If it is not checked, the due dates are generated based on incident date.
<b>Capture coordinates</b>	Select check box to capture an event's coordinates.  Many types of events may be recorded at a facility or be <i>owned-by</i> a health worker at a facility, but actually take place somewhere in the community.
<b>Complete allowed only if validation passes</b>	Select check box to enforce that an event created by this program stage is only completed when all validation rules have passed.
<b>Pre-generate event UID</b>	Select check box to pre-generate unique event id numbers.
<b>Description of report date</b>	Type a description of the report date.  This description is displayed in the case entry form.

7. Assign data elements:

- In the list of **Available data elements**, double-click the data elements you want to assign to the program stage.
- For each assigned data element, review the properties. You can select:

**Table 20.4.**

Option	Description
<b>Compulsory</b>	The value of this data element must be filled into data entry form before completing the event.
<b>Allow provided elsewhere</b>	Specify if the value of this data element comes from other facility, not in the facility where this data is entered.

Option	Description
<b>Display in reports</b>	Display the value of this data element into the single event without registration data entry function.
<b>Date in future</b>	Allow to select a date in future for date data elements.

8. Click **Add**.

### 20.3.3. Create a program stage section

1. Open the **Program / Attributes** app and click **Program**.
2. Click the program you want to add a program stage section to and select **View program stages**.  
A list of existing stages for the selected program opens. If the program doesn't have any program stages, the list is empty.
3. Click a program stage and select **Section management**.
4. Click **Add new**.
5. Enter a program stage section **Name**.
6. In the list of **Available data elements**, double-click the data elements you want to assign to the program stage section.
7. In the list of **Available indicators**, double-click the indicators you want to assign to the program stage section.
8. Click **Add**.

### 20.3.4. Change program stage sort order

1. Open the **Program / Attributes** app and click **Program**.
2. Click the relevant program and select **View program stages**.  
A list of existing stages for the selected program opens. If the program doesn't have any program stages, the list is empty.
3. Click **Sort order**.
4. Modify the order of the program stages with the up and down arrows.
5. Click **Save**.

### 20.3.5. Change program stage section sort order

1. Open the **Program / Attributes** app and click **Program**.
2. Click the relevant program and select **View program stages**.  
A list of existing stages for the selected program opens. If the program doesn't have any program stages, the list is empty.
3. Click a program stage and select **Section management**.
4. Click **Sort order**.
5. Modify the order of the program stage sections with the up and down arrows.
6. Click **Save**.

### 20.3.6. Edit program stages

1. Open the **Program / Attributes** app and click **Program**.

---

**2. Click the relevant program and select **View program stages**.**

A list of existing stages for the selected program opens. If the program doesn't have any program stages, the list is empty.

**3. Click the program stage you want to modify and select **Edit**.****4. Modify the options you want.****5. Click **Update**.**

### 20.3.7. Display program stages

**1. Open the **Program / Attributes** app and click **Program**.****2. Click the relevant program and select **View program stages**.**

A list of existing stages for the selected program opens. If the program doesn't have any program stages, the list is empty.

**3. Click the program stage you want to display and select **Show details**.**

### 20.3.8. Translate program stages

**1. Open the **Program / Attributes** app and click **Program**.****2. Click the relevant program and select **View program stages**.**

A list of existing stages for the selected program opens. If the program doesn't have any program stages, the list is empty.

**3. Click the program stage you want to modify and select **Translate**.****4. Select a locale.****5. Type a **Name**.****6. Click **Save**.**

## 20.4. Manage program notifications

### 20.4.1. About program notifications

You can create program notifications for programs with registration and their program stages. The notifications are sent either via the internal DHIS2 messaging system, via e-mail or via text messages (SMS). You can use program notifications to, for example, send an automatic reminder to a tracked entity 10 days before a scheduled appointment. You use the program's tracked entity attributes (for example first name) and program parameters (for example enrollment date) to create a notification template.

In the **Parameters** field, you'll find a list of available tracked entity attributes and the following program parameters:

**Table 20.5.**

<b>Notification type</b>	<b>Variable name</b>	<b>Variable code</b>
Program	Current date	v{current_date}
	Days since enrollment date	v{days_since_enrollment_date}
	Enrollment date	v{enrollment_date}
	Incident date	v{incident_date}

Notification type	Variable name	Variable code
	Organisation unit name	V{org_unit_name}
	Program name	V{program_name}
Program stage	Current date	V{current_date}
	Days since due date	V{days_since_due_date}
	Days until due date	V{days_until_due_date}
	Due date	V{due_date}
	Organisation unit name	V{org_unit_name}
	Program name	V{program_name}
	Program stage name	V{program_stage_name}

## 20.4.2. Create a program notification

### Update Program Notification

#### Enrollment notification

##### Program Notification details

Name *	Enrollment notification
Trigger by	Program enrollment
Recipients	User group
User group	Family Health Partner
Parameters	Program name Organisation Unit name Current date Enrollment Date Days since enrollment date
Subject template	New enrollment in V{program_name}
Message template	A new enrollment was registered for V{program_name} for A{w75KJ2mc4zz} A{zDhuuAYrxNC} at health facility V{org_unit_name} at V{current_date}.
<input type="button" value="Save"/> <input type="button" value="Cancel"/>	

1. Open the **Program / Attributes** app and click **Program**.
2. Click the relevant program and select **View program notifications**.

A list of existing program notifications for the selected program opens. If the program doesn't have any program notifications, the list is empty.

3. Click **Add new**.
4. Enter a **Name**.
5. In the **Trigger by** field, select what should trigger the notification.

**Table 20.6.**

<b>Trigger</b>	<b>Description</b>	<b>Note</b>
Program enrollment	The program notification is sent when the TEI enrolls in the program.	-
Program completion	The program notification is sent when the program of TEI is completed	-
Days scheduled (incident date)	The program notification is sent XX number of days before or after the incident date	You need to enter the number of days before or after the scheduled date that the notification will be sent.
Days scheduled (enrollment date)	The program notification is sent XX number of days before or after the enrollment date	You need to enter the number of days before or after the scheduled date that the notification will be sent.

6. In the **Recipients** field, select who should receive the program notification.

**Table 20.7.**

<b>Recipient type</b>	<b>Description</b>	<b>Note</b>
Tracked entity instance	Receives program notifications via e-mail or text message.	To receive a program notification, the recipient must have an e-mail address or a phone number attribute.
Organisation unit contact	Receives program notifications via e-mail or text message.	To receive a program notification, the receiving organisation unit must have a registered contact person with e-mail address and phone number.
Users at organisation unit:	All users registered to the selected organisation unit receive program notifications via the internal DHIS2 messaging system.	-
User group	All members of the selected user group receive the program notifications via the internal DHIS2 messaging system	-

7. Create the **Subject template**.

Double-click the parameters in the **Parameters** field to add them to your subject.

### Note

The subject is not included in text messages.

8. Create the **Message template**.

Double-click the parameter names in the **Parameters** field to add them to your message.

### Example 20.6.

Dear A{w75KJ2mc4zz}, You're now enrolled in V{program\_name}.

9. Click **Save**.

### Note

You configure when the program notifications are sent in the **Data Administration** app > **Scheduling > Program notifications scheduler**.

- Click **Run now** to send the program notifications immediately.
- Select a time and click **Start** to schedule the program notifications to be send at a specific time.

### 20.4.3. Create a program stage notification

1. Open the **Program / Attributes** app and click **Program**.
2. Click the relevant program and select **View program stages**.
3. Click the relevant program stage and select **View program stage notifications**.
- A list of existing program stage notifications for the selected program stage opens. If the program stage doesn't have any program stage notifications, the list is empty.
4. Click **Add new**.
5. Enter a **Name**.
6. In the **Trigger by** field, select what should trigger the notification.

**Table 20.8.**

Trigger	Description	Note
Program stage completion	The program stage notification is sent when the program stage is completed	-
Days scheduled (due date)	The program stage notification is sent XX number of days before or after the due date	You need to enter the number of days before or after the scheduled date that the notification will be send.

7. In the **Recipients** field, select who should receive the program stage notification. You can select:

**Table 20.9.**

Recipient type	Description	Note
Tracked entity instance	Receives program notifications via e-mail or text message.	To receive a program stage notification, the recipient must have an e-mail address or a phone number attribute.
Organisation unit contact	Receives program notifications via e-mail or text message.	To receive a program stage notification, the receiving organisation unit must have a registered contact person

Recipient type	Description	Note
		with e-mail address and phone number.  The system selects the same organisation unit as where the event took place.
Users at organisation unit:	All users registered to the selected organisation unit receive program notifications via the internal DHIS2 messaging system.	-
User group	All members of the selected user group receive the program notifications via the internal DHIS2 messaging system	-

## 8. Create the **Subject template**.

Double-click the parameter names in the **Parameters** field to add them to your subject.

 **Note**

The subject is not included in text messages.

## 9. Create the **Message template**.

Double-click the parameter names in the **Parameters** field to add them to your message.

**Example 20.7.**

Dear A{w75KJ2mc4zz}, please come to your appointment the V{due\_date}.

10Click **Save**.

**Note**

You configure when the program stage notifications are sent in the **Data Administration** app > **Scheduling** > **Program notifications scheduler**.

- Click **Run now** to send the program notifications immediately.
- Select a time and click **Start** to schedule the program notifications to be send at a specific time.

## 20.5. Manage custom registration forms

### 20.5.1. About program custom registration forms

You can create custom registration form for each available program in system or for normal registration form which is used to register any entity without having program information and this entity can enroll into a certain program after that.

**Note**

Check on *Auto save registration form* check box in *Design tracked entity form* to save the custom registration form to being designed automatically.

## 20.5.2. About program stage data entry forms

A program stage has three types of data entry forms:

1. *Custom data entry form*: Define a data entry form as HTML page. Click on the program stage which you would like and select to define custom data entry form. The system supports to define a custom entry form with multi stages. So this form can be re-used in other stages of the same program.
2. *Section data entry form*: Group some data elements which belong to the program stage as sections and display data elements by each section. Click on the program stage which you would like and select *Section management* link to define section data entry form.
3. *Default data entry form*: List all data elements which belong to the program stage.

## 20.5.3. Create a custom program registration form

1. Open the **Program / Attributes** app and click **Program**.
2. Click the program you want to add a custom registration form to and select **Design custom registration form**.
3. Enter a **Name**.
4. Create the form in the built-in WYSIWYG HTML editor. If you select **Source**, you can paste HTML code directly in the editing area. You can also insert images.
5. Click **Save**.

## 20.5.4. Create a program stage data entry form

1. Open the **Program / Attributes** app and click **Program**.
2. Click the program you want to add a program stage data entry form to and select **View program stages**.  
A list of existing stages for the selected program opens. If the program doesn't have any program stages, the list is empty.
3. Click the program stage you want to add a program stage entry form to and select **Design data entry form**.
4. Enter a **Name**.
5. Create the form in the built-in WYSIWYG HTML editor. If you select **Source**, you can paste HTML code directly in the editing area. You can also insert images.
6. Click **Save**.

# Chapter 21. About sharing of objects

This chapter discusses the sharing of entities feature in DHIS2.

## 21.1. Sharing of objects

Many objects in DHIS2, like reports, charts, maps and indicators, can be shared. Sharing means making an object, like a report, available for reading or modification to a group of users or to everyone. For instance for reports, the sharing dialog can be opened by clicking on the "Sharing settings" button next to each report in the list. Implementers can use this feature to allow access to certain objects to only certain user groups. Users can use the feature to decide who they would like to share objects (such as pivot tables, charts, dashboards, etc) with.

If sharing is supported for a particular class of objects, a dialog will be available called "Sharing settings", usually available by clicking on the name of the object or in the analytics tools, through an icon (Share with other people). Once you have accessed the sharing settings for the object you wish to share, a dialog similar to the one below will be shown.

### The sharing dialog

Sharing settings

Antenatal Care

Search for user groups

External access (without login)

Public access (with login)

Africare HQ

None

Can edit and view

Cancel Save

### The sharing dialog in the Maintenance app

Sharing settings

Births attended by

Created by: Tom Wakiki

Who has access

- Public access Anyone can find, view and edit
- External access No access
- Administrators
- John Barnes

Add users and user groups

Enter names

CLOSE

You can share your report with everyone or with a number of user groups. "External access" can be enabled to allow this resource to be shared with everyone, including users which cannot

logon to DHIS2. This is useful for sharing public resources with external systems. Note, that if objects are shared externally, then they are visible to anyone who has access to the URL which provides the resource without any login credentials.

Next to "Public access" you can choose your public access option: "None", "Can view" or "Can edit and view". Public access refers to users which are logged into the system. Edit also implies deleting the report.

To share with a group, simply start typing the name of the group and the "Search for user groups" input field and select your desired group. Click on the "+" icon next to the input field to share with that group. For each group you can set an access option, similar to public access.

Sharing with a user group implies that all users in that group will get access to the shared object. To create a user group you can go to the dashboard module and click on "Groups". This will lead you to the list of groups where you can click "Add new" in the top right corner. Creating user groups is open for everyone from the dashboard module.

## 21.2. Sharing and access control

The objects which support sharing are indicator, indicator group, indicator group set, data dictionary, data set, program, standard report, resource, report table, chart, map and user group. Out of those objects, report table, chart, map and user group are open for everyone to create privately. Private means that the objects are available only to yourself or potentially to a number of user groups if you choose to share the object. These objects are referred to as "open" objects and can be created by all users. The remaining objects require that your user account has the authority to create them. These objects are referred to as "non-open" objects.

A user can be granted the authority to create publicly accessible objects or privately accessible objects. In order to create a publicly accessible object (available for viewing or editing by anyone) your user account must have the authority to do so. As an example, to create a publicly accessible chart, your user must have the "Create public chart" authority granted. The authority to create private objects applies only to non-open objects. For example, to allow a user to create indicators which will only be accessible to that user and not to everyone, the user can be issued with the "Create private indicator" authority.

Sharing a non-open object with another person and let her edit the object requires that the person's user account has the authority for updating that type of objects granted. For instance, if you want to let another person edit your indicator, that person's user account must have the "Update indicator" authority granted. This does not apply for open objects.

When you create a new object it will automatically become viewable for everyone if your user account has the authority to create public objects. As an example, if you create a standard report and you have the "Create public standard report" authority granted, the report will become viewable for everyone. If you do not have that authority granted the report will be viewable only to yourself. After you have created an object, you may navigate to the "Sharing settings" dialog and set your desired access control level.

If you need a user account which is able to view absolutely all objects you can create a user role with the "ALL" authority and assign a user to that role. If you need to switch between a "complete" view of objects and a "personal" view of objects it is recommended to create two user accounts, one assigned with the "ALL" authority and one without.

## 21.3. Sharing applied

The sharing functionality is useful in several scenarios. One use-case is setting up a DHIS2 instance for a global organisation with operations in multiple countries. Typically the

organisation has a set of global data sets, indicators and reports which should apply to all countries, while all countries will have the need for country-specific data sets, indicators and reports. In this scenario the following approach could work:

- Set up one user group for global personnel.
- Set up a user group for personnel in each country.
- Create global data sets and reports, make them viewable for everyone and editable for the global user group only.
- Create country-specific data sets and reports, make them viewable and editable for the country user group and the global user group only.

This way, the global indicators and reports could be viewed and analysed by everyone, but maintained by the global user group only. The country-specific data sets, indicators and reports could be viewed and maintained by the country and global personnel, without being visible or impacting the system for other countries in the organisation.

A similar approach could work for a scenario with a donor, multiple funding agencies and implementing partners in a country, where user groups could be set up for each of those entities. That way each implementing partner could create and share their reports within their organisation without affecting or allowing access to others. Reports could also be shared with supervisors and funding agencies at the end of reporting periods.

Another use-case is a country department of health with multiple health programs. Typically there is a need for having general reports and charts for the department while allowing the health programs to develop specific reports and charts for internal use. This can be achieved by creating user groups for each health program. Later, when developing reports and charts, these can be made viewable and editable to the program user group only. This way the reports will not be visible to other programs and users. This is beneficial because the reports are kept internal to the program and because the visible list of reports of other users are kept shorter and more relevant.

# Chapter 22. Data Administration

The data administration module provides a range of functions to ensure that the data stored in the DHIS2 database is integral and that the database performance is optimised. These functions should be executed on a regular basis by a data administrator to ensure that the quality of the data stored is optimal.

## 22.1. Data integrity

DHIS2 can perform a wide range of data integrity checks on the data contained in the database. Identifying and correcting data integrity issues is extremely important for ensuring that the data used for analysis purposes is valid. Each of the data integrity checks that are performed by the system will be described, along with general procedures that can be performed to resolve these issues.

### 22.1.1. Data elements without data set

Each data element must be assigned to a data set. Values for data elements will not be able to be entered into the system if a data element is not assigned to a data set. Choose Maintenance->Datasets->Edit from the main menu and then add the "orphaned" data element to the appropriate data set.

### 22.1.2. Data elements without groups

Some Data Elements have been allocated to several Data Element Groups. This is currently not allowed, because it will result in duplication of linked data records in the analytics record sets that provide aggregated data. Go to Maintenance -> Data Element Groups to review each Data Element identified and remove the incorrect Group allocations.

### 22.1.3. Data elements violating exclusive group sets

Some data elements have been allocated to several data element groups that are members of the same data element group set. All group sets in DHIS2 are defined as exclusive, which means that a data element can *only* be allocated to *one* data element group within that group set. Go to Maintenance -> Data elements and indicators ->Data element groups to review each data element identified in the integrity check. Either remove the data element from all groups except the one that it should be allocated to, or see if one of the groups should be placed in a different group set.

### 22.1.4. Data elements in data set but not in form or sections

Data elements have been assigned to a data set, but have not been assigned to any sections of the data set forms. All data sets which use section forms, should generally have all data elements in the data set assigned to exactly one section of the dataset.

### 22.1.5. Data elements assigned to data sets with different period types

Data elements should not be assigned to two separate data sets whose period types differ. The recommended approach would be to create two separate data elements (for instance a monthly and yearly data element) and assign these to respective datasets.

## 22.1.6. Data sets not assigned to organisation units

All data sets should be assigned to at least one organisation unit.

## 22.1.7. Sections with invalid category combinations

Data sets which use section forms should only have a single category combination within each section. This violation could result from assigning a data element to a section, but then changing the category combination of this data element at a later point in time.

## 22.1.8. Indicators with identical formulas

Although this rule will not affect data quality, it generally does not make sense to have two indicators with the exact same definition. Review the identified indicators and their formulas and delete or modify any indicator that appears to be the duplicate.

## 22.1.9. Indicators without groups

All data elements and indicators must be assigned to at least one group, so these Indicators need to be allocated to their correct Data Element and Indicator Group. From the main menu, go to Data elements/Indicators -> Indicator Groups, and allocate each of the `Orphaned` indicators to its correct group.

## 22.1.10. Invalid indicator numerators

Violations of this rule may be caused by an incorrect reference to a deleted or modified data element. Review the indicator and make corrections to the numerator definition.

## 22.1.11. Invalid indicator denominators

Violations of this rule may be caused by an incorrect reference to a deleted or modified data element. Review the indicator and make corrections to the denominator definition.

## 22.1.12. Indicators violating exclusive group sets

Some indicators have been allocated to several indicator groups that are members of the same indicator group set. All group sets in DHIS2 are defined as exclusive, which means that an indicator can *only* be allocated to *one* indicator group within that group set. Go to Maintenance -> Data elements and indicators -> Indicator groups to review each indicator identified in the integrity check. Either remove the indicator from all groups except the one that it should be allocated to, or see if one of the groups should be placed in a different group set.

## 22.1.13. Duplicate periods

If periods have been imported from external applications, it may be possible that some periods will be duplicated. If you have any periods which appear to be duplicated here, you will need to resolve these directly in the DHIS2 database. All data which has been assigned to the duplicated period, should be moved to the correct period, and the duplicate period should be removed.

## 22.1.14. Organisation units with cyclic references

Organisation units cannot be both parent and children of each other, directly nor indirectly. If this situation occurs, you will need to resolve the cyclic reference directly in the DHIS2 database in the "organisation unit" table, by reassigning the "parentid" field of the organisation units.

## 22.1.15. Orphaned organisation units

All organisation units must exist within the organisation unit hierarchy. Go to Organisation-units > Hierarchy Operations and move the offending organisation unit into the proper position in the hierarchy.

## 22.1.16. Organisation units without groups

All organisation units *must* be allocated to at least *one* group. The problem might either be that you have not defined any compulsory OrgUnit Group Set at all, or that there are violations of the compulsory rule for some OrgUnits . NOTE: If you have defined no compulsory OrgUnit Group Sets, then you must first define them by going to Organisation units->Organisation unit group sets and define at least one compulsory Group Set (the group set 'Type' are nearly universally relevant). If you have the relevant group sets, go to Maintenance -> OrgUnit Groups to review each OrgUnit identified and add the relevant Group allocation.

## 22.1.17. Organisation units violating compulsory group sets

These organisation units have not been assigned to the any organisation unit group within one of the *compulsory* organisation unit group sets. When a group set is defined as compulsory, it means that an organisation unit must be allocated to at least one organisation unit group within that group set. For instance, all organisation units must belong to one of the groups in the 'Type' group set. It might belong to the 'Hospital' or the 'Clinic' or any other 'type' group - but it must belong to exactly one of them. Go to Organisation units->Organisation unit groups to review each organisation unit identified in the integrity check. Allocate all organisation units to exactly one compulsory group.

## 22.1.18. Organisation units violating exclusive group sets

Some organisation units have been allocated to several organisation unit groups that are members of the same organisation unit group set. All group sets in DHIS2 are defined as exclusive, which means that an organisation unit can *only* be allocated to *one* organisation unit group within that Group Set. For instance, one organisation unit cannot normally belong to the both the 'Hospital' and 'Clinic' groups , but rather to only to one of them. Go to Organisation units->Organisation unit groups to review each organisation unit identified in the integrity check. Remove the organisation units from all groups except the one that it should be allocated to.

## 22.1.19. Organisation unit groups without group sets

The organisation unit groups listed here have not been allocated to a group set. Go to Maintenance->Organisation unit->Organisation unit group sets and allocate the Organisation unit group to the appropriate group set.

## 22.1.20. Validation rules without groups

All validation rules must be assigned to a group. Go to **Maintenance** app > **Validation rule group** and assign the offending validation rule to a group.

## 22.1.21. Invalid validation rule left side expressions

An error exists in the left-side validation rule definition. Go to **Maintenance** app > **Validation rule** and click **Edit** on the offending rule. Click **Left side** and make the required corrections.

## 22.1.22. Invalid validation rule right side expressions

An error exists in the right-side validation rule definition. Go to **Maintenance** app > **Validation rule** and click **Edit** on the offending rule. Click **Right side** and make the required corrections.

## 22.2. Maintenance

**Table 22.1. Data maintenance functions in the Data Administration app**

Function	Description
Clear analytics tables	Completely empties the analytics tables. These tables are used to generate aggregate data for the pivot tables, GIS and reports.
Remove zero data values	Removes zero data values from the database. Values registered for data elements with aggregation operator average is not removed, as such values will be significant when aggregating the data, contrary to values registered for data elements with aggregation operator sum.  Reducing the number of data values will improve system performance.
Permanently remove soft deleted data values	When a data value is deleted in DHIS2, the system will mark the corresponding database row as deleted, and not actually delete the row.  Running this maintenance function will physically remove these data value rows from the database.
Prune periods	Removes all periods which have no registered data values. Reducing the number of periods will improve system performance.
Remove expired invitations	Will delete users which represent user account invitations that now have gone past their expiry date.
Drop SQL views	DHIS2 lets you set up and manage SQL views as system objects with corresponding database SQL views.  Running this maintenance function will drop underlying SQL views for all system views. Use the <b>Create SQL views</b> function to recreate these SQL views.
Create SQL views	Recreates all SQL views in the database.
Update category option combinations	Rebuilds the category option combinations. This may be required after altering the

Function	Description
	category options which belong to a given category.
Update organisation unit paths	The organisation unit table in the DHIS2 database has a column "path" which contains a concatenated string of all ancestors in the hierarchy for each organisation unit.  Running this maintenance function will update and ensure that these values are in sync with the current organisation unit hierarchy. This column is managed by DHIS2, but a manual update might be useful when doing data loading directly in the database.
Clear application cache	Clears the system cache.
Reload apps	Manually reloads and detects installed DHIS2 apps.  The installed apps are also detected when the system starts and when installing or uninstall apps.

## 22.3. Resource tables

Resource tables are supporting tables that are used during analysis of data. One would typically join the contents of these tables with the data value table when doing queries from third-party applications like Microsoft Excel. They are also used extensively by the analysis modules of DHIS2. Regeneration of the resource tables should only be done once all data integrity issues are resolved. The resource tables are also generated automatically, every time the analytics process is run by the system.

- Organisation unit structure (\_orgunitstructure)

This table should be regenerated any time there have been any changes made to the organisational unit hierarchy. This table provides information about the organisation unit hierarchy. It has one row for each organisation unit, one column for each organisation unit level and the organisation unit identifiers for all parents in the lineage as values.

- Data element group set structure (\_dataelementgroupsetstructure)

This table provides information about which data elements are members of which data element group sets. The table has one row for each data element, one column for each data element group set and the names of the data element group as values.

- Indicator group set structure (\_indicatorgroupsetstructure)

This table provides information about which indicators are members of which indicator group sets. The table has one row for each indicator, one column for each indicator group set and the names of the indicator group as values.

- Organisation unit group set structure (\_organisationunitgroupsetstructure)

This table provides information about which organisation units are members of which organisation unit group sets. The table has one row for each organisation unit, one column for each organisation unit group set and the names of the organisation unit groups as values.

- Category structure (\_categorystructure)

This table provides information about which data elements are members of which categories. The table has one row for each data element, one column for each category and the names of the category options as values.

- Data element category option combo name (\_categoryoptioncomboname)

This table should be regenerated any time there have been changes made to the category combination names. It contains readable names for the various combinations of categories.

- Data element structure (\_dataelementstructure)

This table provides information about all data elements and which period type (frequency) they capture data at. The period type is determined through the data set membership and hence relies on data elements to be member of data sets with similar period types to have a defined behavior.

- Period structure (\_dataperiodstructure)

This table provides information about all periods and which period type they are associated with. For each period type with lower frequency than itself, it contains information about which period it will fall within.

- Data element category option combinations (\_dataelementcategoryoptioncombo)

This table provides a mapping between data elements and all possible category option combinations.

## 22.4. Locale Management

It is possible to create custom locales in DHIS2. In addition to the locales available through the system, you might want to add a custom locale such as "English" and "Zambia" to the system. This would allow you to translate metadata objects to local languages, or to account for slight variants between countries which use a common metadata definition.

Create New Locale

Locale Details	
Language	English
Country	Zambia
Add	Cancel

The locale is composed of a language along with a country. Select the desired values and press "Add". This custom locale will now be available as one of the translation locales in the system.

## 22.5. SQL View

The SQL View functionality of DHIS2 will store the SQL view definition internally, and then materialize the view when requested.

Database administrators must be careful about creating database views directly in the DHIS2 database. For instance, when the resource tables are generated, all of them will first be dropped and then re-created. If any SQL views depend on these tables, an integrity violation exception will be thrown and the process will be aborted.

The SQL views are dropped in reverse alphabetical order based on their names in DHIS2, and created in regular alphabetical order. This allows you to have dependencies between SQL views, given that views only depend on other views which come earlier in the alphabetical order. For instance, "ViewB" can safely depend on "ViewA". Otherwise, having views depending on other view result in an integrity violation error.

## 22.5.1. Creating a new SQL view

To create a new SQL view, click **Apps > Data administration >SQL view** and click **Add new**.

The "Name" attribute of the SQL view will be used to determine the name of the table that DHIS2 will create when the view is materialized by the user. The "Description" attribute allows one to provide some descriptive text about what the SQL view actually does. Finally, the "SQL statement" should contain the SQL view definition. Only SQL "SELECT" statements are allowed and certain sensitive tables (i.e. user information) are not accessible. Press "Save" to store the SQL view definition.

## 22.5.2. SQL View management

In order to utilize the SQL views, simply click the view and from the context menu, choose "Execute query". Once the process is completed, you will be informed that a table has been created. The name of the table will be provided, and is composed from the "Description" attribute provided in the SQL view definition. Once the view has been generated, you can view it by clicking the view again, and selecting "Show SQL View".

### Tip

If you have a view which depends on another view, you should be careful about how the views are named. When analytics is run on the DHIS2 server, all views must be dropped, and are recreated. When analytics starts, the views are dropped in alphabetical order, and then recreated in reverse alphabetical order. Thus, if view A depends on view B, it must appear before view B in alphabetical order. If it appears after view B in alphabetical order, analytics may fail, as the view with dependencies will not be dropped in the correct order.

## 22.6. Duplicate data elimination

This function is useful when data has been entered mistakenly for two data elements which represents the same phenomena.

Start by selecting the data element to eliminate from the list and click confirm. Then select the data element to keep and click confirm again. Finally, verify the selection and click merge.

In the situation where data exists for the data element to eliminate and not for the one to keep, the data will be moved to the one to keep. When data exists for both data elements, the data which was updated last will be used. When data exists only for the one to keep, no action will be taken. The data element to eliminate will eventually be deleted, except when it is a multidimensional data element and has other data registered.

## 22.7. Data statistics

The data statistics module provides an overview of the number of objects stored in the DHIS2 database.

### Data Statistics

Object type	Number
Data elements	714
Data element groups	79
Indicator types	5
Indicators	59
Indicator groups	15
Data sets	18
Organisation units	1332
Validation rules	36
Periods	57
Users	19
Data values	3907860
Users logged in	Number
Last hour	1
Today	3
Yesterday	3
Last 7 days	4
Last 30 days	4
Data values	Number
Today	0
Yesterday	0
Last 7 days	0
Last 30 days	0

The total number of each type of object is presented in a series of tables with summary statistics of each object.

## 22.8. Lock exceptions

Lock exceptions provide fine-grained control over exemption from a locked data set. After the expiry of the data set, data entry will be denied by default, unless an exception has been granted through the Lock exception interface. To enable a lock exception, select the desired organization units, data sets, and time period and press "Add". By granting a lock exception, data entry will be enabled even after the expiry period of the data set has passed.

## Create new lock exception

**Organisation Unit Selection**

Select at level: Federal Governn [ ] Un-select at level [ ] Unselect all [ ]  
Select in group: AIDSRelief [ ] Un-select in group [ ] Select children [ ]

- ng Federal Government
  - ab Abia State
    - ab Aba North Local Government Area
      - ab Abundant Life Organization
      - ab Annabelles BOGI Development Initiative
      - ab Seventh Day Hospital
    - ab Aba South Local Government Area
      - ab Arochukwu Local Government Area
    - ab Bende Local Government Area
      - ab Ikwuano Local Government Area
    - ab Isiala-Ngwa North Local Government Area
    - ab Isiala-Ngwa South Local Government Area
      - ab Isiukwato Local Government Area
    - ab Obio Nwga Local Government Area
      - ab Ohafia Local Government Area
    - ab Osisioma Ngwa Local Government Area
      - ab Ugwunagbo Local Government Area
    - ab Ukwu East Local Government Area
    - ab Ukwu West Local Government Area

Care & Support [ ]  
February 2012 [ ]

Add [ ] Cancel [ ]

In the example above, a data lock exception would be created for "ab Abundant Life Organization" and "ab Seventh Day Hospital" for the "Care and Support" dataset for "February 2012".

## 22.9. Min-Max Value Generation

This administrative function can be used to generate min-max values, which are used as part of the data quality and validation process for specific organization units and data sets. Simply select the dataset from the left hand frame, and then select the required organisation units to generate the min-max values for from the organisational units selector on the right. Press the "Generate" button to generate or regenerate all min-max values. Press "Remove" to remove all min-max values which are currently stored in the database.

## Min-Max Value Generation

Available data sets	Organisation Unit Selection
<input type="checkbox"/> Care & Support <input type="checkbox"/> HCTesting <input type="checkbox"/> HSS Dataset <input type="checkbox"/> PMTCT <input type="checkbox"/> Prevention <input type="checkbox"/> Treatment <input type="checkbox"/> OVC Dataset	<p>Select at level: Federal Governn [ ] Un-select at level [ ] Unselect all [ ]  Select in group: AIDSRelief [ ] Un-select in group [ ] Select children [ ]</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> ng Federal Government           <ul style="list-style-type: none"> <li><input type="checkbox"/> ab Abia State               <ul style="list-style-type: none"> <li><input type="checkbox"/> ab Aba North Local Government Area                   <ul style="list-style-type: none"> <li>ab Seventh Day Hospital</li> </ul> </li> <li><input type="checkbox"/> ab Aba South Local Government Area                   <ul style="list-style-type: none"> <li>ab Aba Health Office</li> <li>ab Aba IDH Hospital</li> </ul> </li> </ul> </li> </ul> </li></ul>

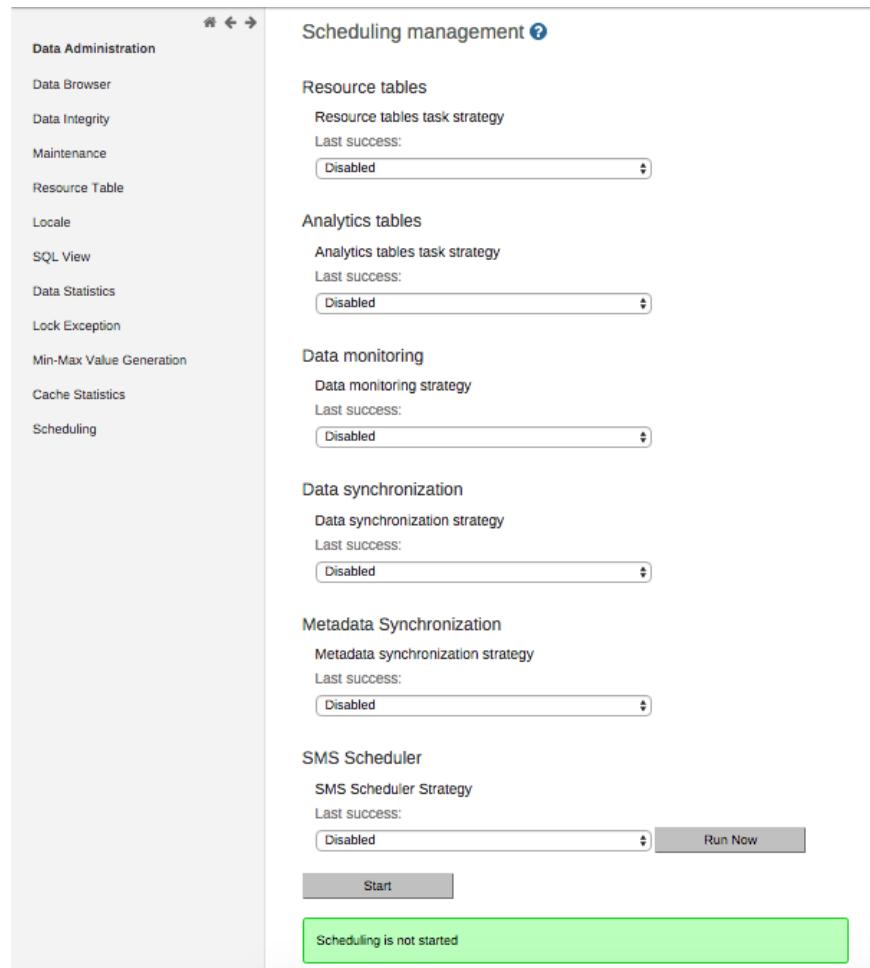

## 22.10. Cache Statistics

This option is for system administrators only to use. The cache statistics shows the status of the application level cache. The application level cache refers to the objects and query results that the application is caching in order to speed up performance. If the database has been modified directly the application cache needs to be cleared for it to take effect.

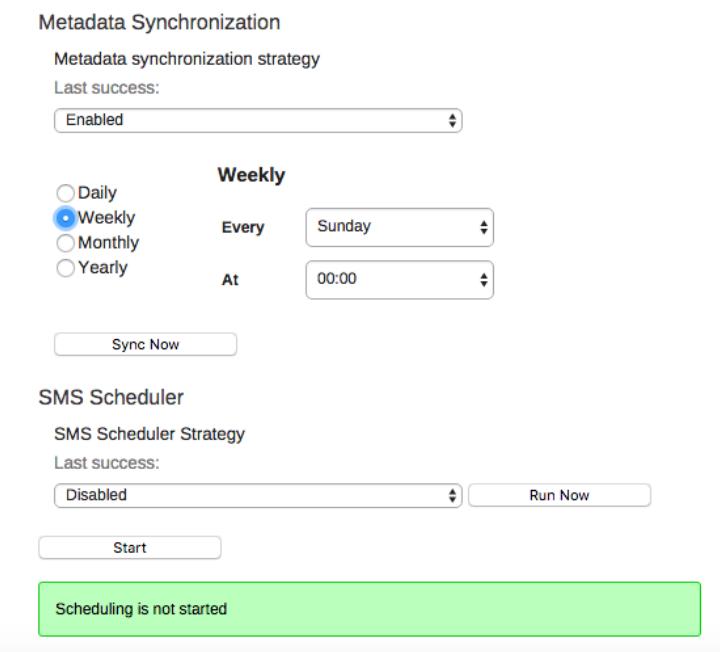

## 22.11. Scheduling

The analytics, resource tables, data sync, metadata sync and data mart can be automatically scheduled to run on regular intervals. Simply select the aggregation period types, organisation unit group set aggregation level, and strategy to configure how the scheduled job should run. If you are using surveillance rules, you can choose to run them "All daily" by selecting this option.

Pressing "Start" will enable the scheduled job to run at a pre-determined time (always at midnight based on the server time).

Starting 2.24 you can also schedule metadata synchronization on regular intervals. Simply select "Enabled" from the drop-down, select the time-period during which you want to run the task. Pressing "Start" will enable the scheduled job to run at that specific time selected.

As depicted in the screenshot, you can select the time period as daily, weekly, monthly or yearly.

- Daily: On selecting this checkbox, you will need to select the time at which it needs to run daily.
- Weekly: On selecting this checkbox, you need to select the day of the week and time on that day on which it needs to run.
- Monthly: On selecting this checkbox, you need to select a day of the week, say Every 1st Sunday, Every 2nd Saturday, etc. and time on that day on which it needs to run.
- Yearly: On Selecting this check box, you need to select the month, specific day of the month and time on that day on which it needs to run.

There is also the capability for running the meta data synchronization immediately. Using "**Sync Now**" button you can run the meta data synchronization task immediately even if the scheduler is scheduled to run at specific time or not.

- If the scheduler is already enabled, you will see the "Sync Now" button on the page itself.
- If the scheduler is not enabled, simply select "Enabled" from the drop-down for Metadata Synchronization and click "Sync Now" button.

## 22.12. Data synchronization

DHIS2 provides a feature for synchronizing data being captured on the local instance with a another, remote instance of DHIS2. This can be useful e.g. when you have deployed multiple stand-alone instances of DHIS2 which are required to submit data values to a central DHIS2 instance. Till now only aggregate data was being synced. Starting from 2.24 even non anonymous events data (line list) will also be synced.

These are the steps to enable data synchronization:

- Go to Settings > Synchronization, enter the remote server URL, username and password and click Save. You can test your settings by clicking on the "Test settings" link.
- Go to Data administration > Scheduling. Under Data synchronization set strategy to Enabled, and click Start.

Some aspects of the data synchronization feature to be aware of:

- The local DHIS2 instance will store the password of the user account on the remote instance encrypted in the local database. The remote account is used for authentication when transferring data. For security purposes make sure you set the "enryption.password" configuration parameter in hibernate.properties to a strong password.
- Deploying the remote server on SSL/HTTPS is strongly recommended as the username and password are sent in clear text using basic authentication and could be intercepted by an attacker.
- The data synchronization uses the UID property of data elements, category option combos and organisation units to match the meta-data. Hence the synchronization is dependent on these three meta-data objects being harmonized on the local and remote instance in order to work appropriately.
- The very first time DHIS2 attempts to synchronize data the system will include data entered during the last three days. For the subsequent attempts the system will store the time of the last successful data synchronization and only include data saved or edited since that time. A synchronization job is considered successful only if data was submitted, authenticated and saved successfully on the remote server.,
- The system will attempt a synchronization every minute. If the local server does not have a working Internet connection at the time, the synchronization will be silently aborted and re-attempted after a minute.
- You can see the time of last successful synchronization with remote server in the scheduling screen next to the "Last success" label.

## 22.13. Metadata Synchronization Scheduling

DHIS2 provides a feature for synchronizing meta data from a remote instance to a local instance of DHIS2. This can be useful when you have deployed multiple stand-alone instances of DHIS2 and you need to create meta data in all the local instances similar to the central DHIS2 instance.

These are the steps to enable meta data synchronization:

- Go to Settings > Synchronization, enter the remote server URL, username and password and click Save.
- Go to Metadata administration > Scheduling. Under Metadata synchronization set strategy to Enabled, select the time-period and click Start.

Some aspects of the meta data synchronization feature to be aware of:

- The local DHIS2 instance will store the password of the user account of the remote instance in its database. The remote user account is used for authentication when transferring/downloading data. For security purposes make sure you set the "encryption.password" configuration parameter in hibernate.properties to a strong password.
- Deploying the remote server on SSL/HTTPS is strongly recommended as the username and password are sent in clear text using basic authentication and could be intercepted by an attacker.
- Also ensure that the remote user is not having ALL authority, instead simply create a user with F\_METADATA\_MANAGE authority so that even if these details are intercepted by a hacker, one cannot have full control of the remote system.
- The meta data synchronization relies on the underlying import layer. Each meta data version is an export of meta data between two given timestamps. Each sync of meta data version is an attempt to import that meta data snapshot into the local instance. The sync of versions is incremental. The local instance will try to download the meta data versions from the central instance one after the other. Failure to sync a specific meta data version will not let the sync proceed to further versions. In case of failures, appropriate changes must be made to meta data at central to ensure that the error gets resolved. Metadata configuration is critical and the configurator should be careful while rolling out the updates to the production. It's always recommended to have staging environments in place to ensure the sanity of the meta data versions and their impact thereafter. The local instance will sync the meta data from first version so that harmony is maintained and local and central instance will work appropriately.
- The system will attempt a synchronization at the scheduled time. If the local or remote server does not have a working Internet connection at the time, the synchronization will be aborted and re-attempted after as per the retry count as mentioned in the dhis.conf file.
- You can see the time of last successful synchronization with remote server in the scheduling screen next to the "Last success" label.

# Chapter 23. Datastore Manager

The Datastore Manager is intended for advanced-level DHIS2 users. Before you use the Datastore Manager, you can read more about the Data store here: [DHIS2 data store](#).

## 23.1. Using the Datastore Manager

The Datastore Manager lets you manage the content of the web API data stores. This is helpful when managing apps and external scripts.

## 23.2. Add a new namespace and key to the Datastore Manager

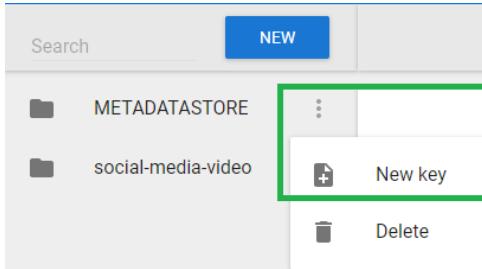

Note: You have to create a namespace before you can add a key to it.

1. Click **New**.
2. Enter a name for the namespace you want to create.
3. Enter a key name, and select **Create**. The new namespace displays in the left pane.

## 23.3. Add a key to an existing namespace in the Datastore Manager

To add a new key to an existing namespace in the Datastore Manager,

1. Select the namespace you want to add a key to.
2. Click the options menu, and click **New key**.

3. Enter a key name in the New key dialog box.
4. Click **Create**. The new key is added to the namespace you selected.

## 23.4. Delete a namespace or key from the Datastore Manager

To delete a namespace, or key, click the Options menu, and then click **Delete**, and then **Delete** again. Note that if you delete the only key in a namespace, you will also delete the namespace it belongs to.

## 23.5. Search for namespaces or keys

Use the search tool in the top left corner to search for namespaces and keys as follows:

- Enter a namespace name followed by # and the key name to search for a specific key in a namespace.
- Enter # followed by the name of a key to search for keys only.

## 23.6. Search your JSON library

Use the search tool in the workspace toolbar to search your JSON library.

## 23.7. Edit namespaces or keys in the Datastore Manager

Use the **Search** tool to find namespaces or keys in your datastore. When you edit your content, you can toggle between the **Tree** view and the **Code** view. Use the **Tree** view to get an overview of the contents of the Datastore. Use the **Code** view to edit your code directly in the code editor. Remember to save your work by clicking the **Save** button.

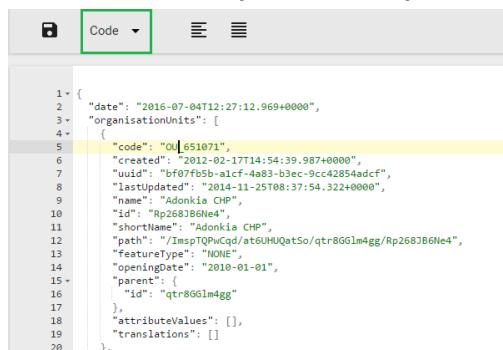

```

    □ ▾ object {63}
  :: □   date : 2016-07-04T12:27:12.969+0000
  :: □   ▶ organisationUnits [1332]
  :: □   ▶ constants [2]
  :: □   ▶ reportTables [101]
  :: □   ▶ attributes [6]
  :: □   ▶ dataApprovalWorkflows [2]
  :: □   ▶ maps [82]
  :: □   ▶ translations [6224]

```

In the Code view, you can edit your code. When you edit a line of code, it is highlighted in yellow.

Any errors are marked by the editor. If you hover over the error icon, you can view a short description of the error.

# Chapter 24. Configure the GIS app

## 24.1. Context

Setting up the GIS simply means storing coordinates for the organisation units you want to show on the map in the database. Coordinates are often distributed in proprietary formats and will need to be converted to a format which DHIS2 understands. ESRI shapefiles are the most common geospatial vector data format for desktop applications. You might find shapefiles for your country [here](#) or in many other geospatial data repositories on the web. Some amount of work needs to be done in order to use these coordinates in DHIS2 GIS, namely transforming the data into a suitable format and ensuring the names which are contained in the geospatial data match exactly with the names of the organization units which they should be matched to.

If you go to the organisation unit module and edit one of the units, you can see a text field called Coordinates. Here you may fill in its coordinates directly (geojson format) which is useful if you just want to update a couple of units.

An example point/facility coordinate:

```
[29.341,-11.154]
```

An example polygon/area coordinates string:

```
[[[[29.343,-11.154],[28.329,-11.342],[28.481,-10.239],[29.833,-10.412]]]]
```

However, if you are going to e.g. add coordinates for all units at a certain level you don't want to do that manually. This is where the automatic GML import comes into play and the following section explains the preferred way of using it.

### Important

The only co-ordinate reference system supported by DHIS2 is EPSG:4326, also known as geographic longitude/latitude. Coordinates must be stored with the longitude (east/west position) preceding the latitude (north/south position). If your vector data is in a different CRS than EPSG 4326, you will need to re-project the data first before importing into DHIS2.

## 24.2. Importing coordinates

Step 1 - Simplify/generalize your geographical data

The boundaries in geographical data files are usually very accurate, too much so for the needs of a web-based GIS. This usually does not affect the performance when using GIS files on a local system, but it is usually necessary to optimize the geographical data for the web-based GIS system of DHIS2. All geographical data needs to be downloaded from the server and rendered in a browser, so if the data is overly complex, the performance of the DHIS2 GIS will be negatively impacted. This optimization process can be described as follows:

**Coordinates:** The number of significant decimal digits (e.g. 23.02937874993774) should be shortened to fewer digits (e.g. 23.03). Although this will result in some inaccuracies on the map, given the usual scale at which maps in DHIS2 are produced ( $> 1:50,000$ ), the loss of precision should not be noticeable. Normally, no more than four significant digits after the decimal point should be necessary.

**Polygons:** In addition to shortening the number of significant digits, the actual number of points should also be reduced to an optimal level. Finding this optimal level may take a bit of experimentation. Decreasing the precision of the points as well as the number of points through

generalization, will lead to degradation of the polygon. However, after a bit of experimentation, an optimal level of generalization can be found, where the accuracy of the polygon is visually acceptable, and the performance of the GIS is optimal.

For polygons, we need to make the boundary lines less detailed by removing some of the line points. Make a backup of your shapefiles before you start. One possible method is the use of [MapShaper](#) which is an online tool which can be used to generalize geographical data. To use MapShaper, simply upload your shapefile to the site. Then, at the center bottom you see a slider that starts at 0%. It is usually acceptable to drag it up to about 80%. In the left menu you can check "show original lines" to compare the result and you may want to give a different simplification method a try. When you are happy with the result, click "export" in the top right corner. Then check the first of the four options called "Shapefile - polygons", click "create" and wait for the download buttons to appear. Now, download the two files to your local computer and overwrite the existing ones. Move on to the next step with your new simplified shapefile.

### Step 2 - Convert the shapefile to GML

The recommended tool for geographical format conversions is called "ogr2ogr". This should be available for most Linux distributions **sudo apt-get install gdal-bin**. For Windows, go to <http://fwtools.maptools.org/> and download "FWTools", install it and open up the FWTools command shell. During the format conversion we also want to ensure that the output has the correct coordinate projection (called EPSG:4326 with geographic longitude and latitude). For a more detailed reference of geographic coordinates, please refer to this [site](#). If you have already reprojected the geographic data to the geographic latitude/longitude (EPSG:4326) system, there is no need to explicitly define the output coordinate system, assuming that **ogr2ogr** can determine the input spatial reference system. Note that most shapefiles are using the EPSG:4326 system. You can determine the spatial reference system by executing the following command.

```
ogrinfo -al -so filename.shp
```

Assuming that the projection is reported to be EPSG:27700 by **ogrinfo**, we can transform it to EPSG:4326 by executing the following command.

```
ogr2ogr -s_srs EPSG:27700 -t_srs EPSG:4326 -f GML filename.gml filename.shp
```

If the geographic data is already in EPSG:4326, you can simply transform the shapefile to GML by executing the following command.

```
ogr2ogr -f GML filename.gml filename.shp
```

You will find the created GML file in the same folder as the shapefile.

### Step 3 - Prepare the GML file

Unfortunately, the GML file is not ready for importation yet. Open it in a robust text editor like Geany (Linux) or Notepad++ (Windows). GML is an XML based format which means that you will recognize the regular XML tag hierarchy. In the GML file an organisation unit is represented as a <gml:featureMember>. Inside the feature members we usually find a lot of attributes, but we are just going to import their coordinates.

In order to import geospatial data from the feature members of the GML input, DHIS2 must match each of them with an organisation unit in its database. The feature member element must, in other words, contain a reference to its corresponding organisation unit. The reference itself must be one of three possible DHIS2 identifiers: **uid**, **code** or **name**. The identifier of choice must be provided as a property for each feature member element. The importer will look for a property with the local name of either *Uid*, *Code* or *Name*, e.g. "ogr:Name" or "anyPrefix:Code".

If your feature members already contain a property of the identifier you wish to use (such as the name of an area) you can use search and replace in a text editor to rename these elements

to a name DHIS2 will recognize (see the below table). This is typically a workflow which is applicable when using the name as the identifier (the source shapefile or even GML will usually contain the name for each area it defines).

**Table 24.1. Organisation unit identifiers supported for GML import**

Matching priority	Identifier	Valid spellings	Guaranteed unique
1	Uid	uid, Uid, UID	Yes
2	Code	code, Code, CODE	No
3	Name	name, Name, NAME	No

In the case of renaming properties one would usually find a tag named something like "ogr:DISTRICT\_NAME", "ogr:NAME\_1" and rename it to "ogr:Name". If using the *code* or *uid* identifiers on the other hand, looking up the correct values in the DHIS2 database and going through the GML file, adding the properties for each corresponding feature member might be necessary. In any of the cases it is important to realize that the identifier used must **uniquely** identify an organisation unit (e.g. if there are two organisation units in the database of the same name or code, these cannot be matched properly on either). As *uid* is the only guaranteed-to-be-unique identifier it is the most robust choice. However, as matching on name is usually easier (given that the name is already part of your data), a viable approach to solving uniqueness conflicts can be to match any non-uniquely named organisation units on a different identifier (*uid*, preferably) and the rest on their names.

As can be seen in the above table there is a matching priority, meaning is any two or more identifiers are provided for the same feature member, matching will be performed on the highest priority identifier. Note also the valid properties which can be used in your GML. The namespace prefix is not important as only the local name is used.

A common pitfall of performing preparation of the GML files is syntax- or element naming errors. Therefore please make sure that all properties of the GML file are started and terminated with correctly corresponding tags. Also make sure the properties follow either of the given valid spellings of the property name. The identifying properties are supposed to look like e.g. <ogr:Name>Moyamba District</ogr:Name>, <somePrefix:uid>x7uuia898nJ</somePrefix:uid> or <CODE>OU\_12345</CODE>. Another common error is not making sure the identifier matches exactly, especially when using the *name* property. All matches are performed on exact values, meaning that "Moyamba" in a source GML file would not be matched against "Moyamba District" in the database.

Have a brief look at the identifiers and compare them to the corresponding values in the database. If they seem to match fairly good, it is about time to do a preview in the import-export module.

Go to Services -> Import-Export, select "Preview", select the GML file and click "Import". Look for new/updated organisation units. Our intention is to add coordinates to already existing organisation units in the database, so we want as many updates as possible and 0 new. Those listed as new will be created as root units and mess up the organisation unit trees in DHIS2. If any listed as new, click the number and the organisation units in question will appear in the list below. If there are any slight misspellings compared to the organisation unit names in the database - fix them and do the preview again. Otherwise, click the "discard all" button below the list and then the "Import all" button above the list.

If the import process completes successfully, you should now be able to utilize the geographical data in the DHIS2 GIS. If not, check the log for hints and look for common errors such as:

- Name duplicates in the GML file. The name column in the database is unique and does not accept two organisation units with the same name.

- The "shortname" column in the organisationunit table in your database has a too small varchar definition. Increase it to 100.
- Special name characters in the GML file. Be sure to convert these to appropriate XML equivalents or escape sequences.
- Wrongly formatted input GML, non-matching tags

# Chapter 25. Configure report functionality

## 25.1. Data sources for reporting

### 25.1.1. Types of data and aggregation

In the bigger picture of HIS terminology all data in DHIS2 are usually called aggregated as they are aggregates (e.g. monthly summaries) of medical records or some kind of service registers reported from the health facilities. Aggregation inside DHIS2 however, which is the topic here, is concerned with how the raw data captured in DHIS2 (through data entry or import) are further aggregated over time (e.g. from monthly to quarterly values) or up the organisational hierarchy (e.g. from facility to district values).

#### 25.1.1.1. Terminology

- *Raw data* refers to data that is registered into the DHIS2 either through data entry or data import, and has not been manipulated by the DHIS2 aggregation process. All these data are stored in the table (or Java object if you prefer) called *DataValue*.
- *Aggregated data* refers to data that has been aggregated by the DHIS2, meaning it is no longer raw data, but some kind of aggregate of the raw data.
- *Indicator values* can also be understood as aggregated data, but these are special in the way that they are calculated based on user defined formulas (*factor \* numerator/denominator*). Indicator values are therefore processed data and not raw data, and are located in the *aggregatedindicatorvalue* table/object. Indicators are calculated at any level of the organisational hierarchy and these calculations are then based on the aggregated data values available at each level. A *level* attribute in the *aggregateddatavalue* table refers to the organisational level of the orgunit the value has been calculated for.
- *Period and Period type* are used to specify the time dimension of the raw or aggregated values, and data can be aggregated from one period type to another, e.g. from monthly to quarterly, or daily to monthly. Each data value has one period and that period has one period type. E.g. data values for the periods Jan, Feb, and Mar 2009, all of the monthly period type can be aggregated together to an aggregated data value with the period Q1 2009 and period type Quarterly.

#### 25.1.1.2. Basic rules of aggregation

##### 25.1.1.2.1. What is added together

Data (raw) can be registered at any organisational level, e.g. at national hospital at level 2, a health facility at level 5, or at a bigger PHC at level 4. This varies from country to country, but DHIS2 is flexible in allowing data entry or data import to take place at any level. This means that orgunits that themselves have children can register data, sometimes the same data elements as their children units. The basic rule of aggregation in DHIS2 is that *all raw data is aggregated together*, meaning data registered at a facility on level 5 is added to the data registered for a PHC at level 4.

It is up to the user/system administrator/designer to make sure that no duplication of data entry is taking place and that e.g. data entered at level 4 are not about the same services/visits that are reported by orgunit children at level 5. NOTE that in some cases you want to have duplication of data in the system, but in a controlled manner. E.g. when you have two different

sources of data for population estimates, both level 5 catchment population data and another population data source for level 4 based on census data (because sum of level 5 catchments is not always the same as level 4 census data). Then you can specify using advanced aggregation settings (see further down) that the system should e.g. not add level 5 population data to the level 4 population data, and that level 3,2,1 population data aggregates are only based on level 4 data and does not include level 5 data.

### 25.1.1.2.2. How data gets added together

How data is aggregated depends on the dimension of aggregation (see further down).

Along the orgunit level dimension data is always summed up, simply added together. Note that raw data is never percentages, and therefore can be summed together. Indicator values that can be percentages are treated differently (re-calculated at each level, never summed up).

Along the time dimension there are several possibilities, the two most common ways to aggregate are sum and average. The user can specify for each data element which method to use by setting the aggregation operator (see further down). Monthly service data are normally summed together over time, e.g. the number of vaccines given in a year is the sum of the vaccines given for each month of that year. For population, equipment, staff and other kind of what is often called semi-permanent data the average method is often the one to use, as, e.g. 'number of nurses' working at a facility in a year would not be the sum of the two numbers reported in the six-monthly staffing report, but rather the average of the two numbers. More details further down under 'aggregation operators'.

### 25.1.1.3. Dimensions of aggregation

#### 25.1.1.3.1. Organisational units and levels

Organisational units are used to represent the 'where' dimension associated with data values. In DHIS2, organisational units are arranged in a hierarchy, which typically corresponds to the hierarchical nature of the organisation or country. Organisational unit levels correspond to the distinct levels within the hierarchy. For instance, a country may be organized into provinces, then districts, then facilities, and then sub-centers. This organisational hierarchy would have five levels. Within each level, a number of organisational units would exist. During the aggregation process, data is aggregated from the lower organisational unit levels to higher levels. Depending on the aggregation operator, data may be 'summed' or 'averaged' within a given organisational unit level, to derive the aggregate total for all the organisational units that are contained within a higher level organisational unit level. For instance, if there are ten districts contained in a province and the aggregation operator for a given data element has been defined as 'SUM', the aggregate total for the province would be calculated as the sum of the values of the individual ten districts contained in that province.

#### 25.1.1.3.2. Period

Periods are used to represent the 'when' dimension associated with data values. Data can easily be aggregated from weeks to months, from months to quarters, and from quarters to years. DHIS2 uses known rules of how these different intervals are contained within other intervals (for instance Quarter 1 2010 is known to contain January 2010, February 2010 and March 2010) in order to aggregate data from smaller time intervals, e.g. weeks, into longer time intervals, e.g. months.

#### 25.1.1.3.3. Data Elements and Categories

The data element dimension specifies 'what' is being recorded by a particular data value. Data element categories are actually degenerated dimensions of the data element dimension, and are used to disaggregate the data element dimension into finer categories. Data element categories, such as 'Age' and 'Gender', are used to record a particular data element, typically

for different population groups. These categories can then be used to calculate the overall total for the category and the total of all categories.

#### 25.1.1.4. Aggregation operators, methods for aggregation

##### 25.1.1.4.1. Sum

The 'sum' operator simply calculates the sum of all data values that are contained within a particular aggregation matrix. For instance, if data is recorded on a monthly basis at the district level and is aggregated to provincial quarterly totals, all data contained in all districts for a given province and all weeks for the given quarter will be added together to obtain the aggregate total.

##### 25.1.1.4.2. Average

When the average aggregation operator is selected, the unweighted average of all data values within a given aggregation matrix are calculated.

It is important to understand how DHIS2 treats null values in the context of the average operator. It is fairly common for some organisational units not to submit data for certain data elements. In the context of the average operator, the average results from the number of data elements that are actually present (therefore NOT NULL) within a given aggregation matrix. If there are 12 districts within a given province, but only 10 of these have submitted data, the average aggregate will result from these ten values that are actually present in the database, and will not take into account the missing values.

#### 25.1.1.5. Advanced aggregation settings (aggregation levels)

##### 25.1.1.5.1. Aggregation levels

The normal rule of the system is to aggregate all raw data together when moving up the organisational hierarchy, and the system assumes that data entry is not being duplicated by entering the same services provided to the same clients at both facility level and also entering an 'aggregated' (sum of all facilities) number at a higher level. This is to more easily facilitate aggregation when the same services are provided but to different clients/catchment populations at facilities on level 5 and a PHC (the parent of the same facilities) at level 4. In this way a facility at level 5 and a PHC at level 4 can share the same data elements and simply add together their numbers to provide the total of services provided in the geographical area.

Sometimes such an aggregation is not desired, simply because it would mean duplicating data about the same population. This is the case when you have two different sources of data for two different orgunit levels. E.g. catchment population for facilities can come from a different source than district populations and therefore the sum of the facility catchment populations do not match the district population provided by e.g. census data. If this is the case we would actually want duplicated data in the system so that each level can have as accurate numbers as possible, but then we do NOT want to aggregate these data sources together.

In the Data Element section you can edit data elements and for each of them specify how aggregation is done for each level. In the case described above we need to tell the system NOT to include facility data on population in any of the aggregations above that level, as the level above, in this case the districts have registered their population directly as raw data. The district population data should then be used at all levels above and including the district level, while facility level should use its own data.

##### 25.1.1.5.2. How to edit data element aggregation

This is controlled through something called aggregation levels and at the end of the edit data element screen there is a tick-box called Aggregation Levels. If you tick that one you will see

a list of aggregation levels, available and selected. Default is to have no aggregation levels defined, then all raw data in the hierarchy will be added together. To specify the rule described above, and given a hierarchy of Country, Province, District, Facility: select Facility and District as your aggregation levels. Basically you select where you have data. Selecting Facility means that Facilities will use data from facilities (given since this is the lowest level). Selecting District means that the District level raw data will be used when aggregating data for District level (hence no aggregation will take place at that level), and the facility data will not be part of the aggregated District values. When aggregating data at Province level the District level raw data will be used since this is the highest available aggregation level selected. Also for Country level aggregates the District raw data will be used. Just to repeat, if we had not specified that District level was an aggregation level, then the facility data and district data would have been added together and caused duplicate (double) population data for districts and all levels above.

### 25.1.2. Resource tables

Resource tables provide additional information about the dimensions of the data in a format that is well suited for external tools to combine with the data value table. By joining the data value table with these resource tables one can easily aggregate along the data element category dimension or data element/indicator/organisation unit groups dimensions. E.g. by tagging all the data values with the category option male or female and provide this in a separate column 'gender' one can get subtotals of male and female based on data values that are collected for category option combinations like (male, <5) and (male,>5). See the Pivot Tables section for more examples of how these can be used. orgunitstructure is another important table in the database that helps to provide the hierarchy of orgunits together with the data. By joining the orgunitstructure table with the data values table you can get rows of data values with the full hierarchy, e.g. on the form: OU1, OU2, OU3, OU4, DataElement, Period, Value (Sierra Leone, Bo, Badija, Ngelehung CHC, BCG <1, Jan-10, 32) This format makes it much easier for e.g. pivot tables or other OLAP tools to aggregate data up the hierarchy.

### 25.1.3. Report tables

Report tables are defined, cross-tabulated reports which can be used as the basis of further reports, such as Excel Pivot Tables or simply downloaded as an Excel sheet. Report tables are intended to provide a specific view of data which is required, such as "Monthly National ANC Indicators". This report table might provide all ANC indicators for a country, aggregated by month for the entire country. This data could of course be retrieved from the main datamart, but report tables generally perform faster and present well defined views of data to users.

## 25.2. How to create report tables

To create a new report table, go to the Report tables section of the Reports module (Reports -> Report Table). Above the list of standard reports, use the "Add report table" or "Add Dataelement Dimension Table" buttons. A regular report table can be used to hold data on data elements, indicators or dataset completeness, while Dataelement dimension tables are used to include data element categories in report tables. Creating the tables are done in the same way, however, the only exception being when choosing data.

To create a report table, you start by making some general choices for the table, the most important of which is the crosstab dimension. Then, you choose which data elements, indicators, datasets or data element dimensions you want to include. Finally you select which organisation units and time periods to use in the report table. Each of these steps are described in detail below.

## 25.2.1. General options

### Report table options

Report Table		Crosstab dimensions	
Name	<input type="text"/>	Indicators / data elements / data sets	<input type="checkbox"/>
Sort order	<input type="button" value="None"/>	Organisation units	<input type="checkbox"/>
Top limit	<input type="button" value="None"/>	Periods	<input type="checkbox"/>
Include regression	<input type="checkbox"/>		

### Cross tab dimensions

You can cross-tab one or more of the following dimensions: data element/indicator, orgunit, and period, which means that columns will be created based on the values of the dimensions chosen, e.g. if indicators is selected you will get column names in the table reflecting the names of the selected indicators.

For example, if you cross-tab on indicators and periods, the column headers will say "<indicator title> <period>". The organisation units will be listed as rows. See screenshot for clarification:

#### Indicators and periods are cross-tabbed

Organisation unit	ANC coverage February 2010	ANC coverage 2010
Jappineh Village OPD	0.0	0.0
Jappineh PHC Circuit	0.0	0.0
Jarra Central District	0.0	0.0

If you cross-tab on indicators and organisation units, the column headers of the table will say "<indicator title> <organisation unit>". Now the periods will be listed as rows. See screenshot for clarification:

#### Indicators and organisation units are cross-tabbed

Period	ANC coverage Jarra Central District	ANC coverage Jappineh PHC Circuit	ANC coverage Jappineh Village OPD
2010	0.0	0.0	0.0
February 2010	0.0	0.0	0.0

Note that the options made here regarding crosstab dimensions may have consequences for what options are available when using the report table as a data source later, for example for standard reports.

### Sort order

Affects the rightmost column in the table, allows you to choose to sort it low to high or high to low.

### Top limit

Top limit allow you to set a maximum number of rows you want to include in the report table.

### Include regression

This adds additional columns with regression values that can be included in the report design, e.g. in line charts.

## 25.2.2. Selecting data

### Data options

The screenshot shows a user interface for selecting data elements. At the top, there's a header 'Available indicators' with a button '[ Select indicator group / View all ]'. Below it is a scrollable list of indicators: 'AFP Non-polio rate', 'ANC Registrants receiving IPT1', 'ANC Registrants receiving IPT2', 'ANC Registrants receiving IPT3', 'Average number of ANC visits per registrants', and 'Average number of visits per client'. Below the list are four buttons: 'Add selected', 'Add all', 'Remove selected', and 'Remove all'. Below these buttons is another header 'Selected indicators', followed by a large empty scrollable area.

### Indicators/Data elements

Here you select the data elements/indicators that you want to include in the report. Use the group filter to more easily find what you are looking for and double click on the items you want to include, or use the buttons to add/remove elements. You can have both data elements and indicators in the same report.

### Data sets

Here you select the data sets that you want to include in the report. Including a data set will give you data on the data completeness of the given set, not data on its data elements. Double click on the items you want to include, or use the buttons.

## 25.2.3. Selecting report parameters

### Report parameter options

The screenshot shows report parameter options. At the top, there are two blue buttons: 'Toggle fixed organisation units' and 'Toggle fixed periods'. Below them is a section titled 'Relative periods' with several checkboxes: 'Reporting month' (unchecked), 'Months this year' (unchecked), 'Quarters this year' (unchecked), 'This year' (unchecked), 'Months last year' (unchecked), 'Quarters last year' (unchecked), and 'Last year' (unchecked). Below this is a section titled 'Report parameters' with checkboxes: 'Reporting month' (unchecked), 'Grand parent organisation unit' (unchecked), 'Parent organisation unit' (unchecked), and 'Organisation unit' (unchecked).

There are two ways to select both what organisation units to include in a report, and what time periods should be included: relative, or fixed. Fixed organisation units and/or periods means that you select the units/periods to include in the report table when you create the report table. Using relative periods, you can select the time and/or units as parameters when the report table is populated, for example when running a standard report or creating a chart. A combination is also possible, for example to add some organisation units in the report permanently while letting the users choose additional. Report parameters is discussed below. In general, using fixed organisation units and/or time periods are an unnecessary restriction.

### Fixed Organisation Units

To add fixed organisation units, click "Toggle fixed organisation units". A panel will appear where you can choose orgunits to always include in the report. If you leave it blank, the users select orgunits when running the report through the use of report parameters. Use the drop down menu to filter organisation units by level, double click or use the buttons to add/remove.

### Fixed Periods

To add fixed periods, click "Toggle fixed organisation units". A panel will appear where you can choose periods to always include in the report. If you leave it blank, the users select periods when running the report through the use of report parameters. Use the drop down menu to choose period type (week, month, etc), the Prev and Next button to choose year, and double click or use the buttons to add/remove.

## Relative periods

Instead of using fixed/static periods like 'Jan-2010' or 'Q1-2010', more generic periods can be used to create reusable report tables, e.g. for monthly reports the period 'Reporting month' will simply pick the current reporting month selected by the user when running the report. Note that all relative periods are relative to a "reporting month". The reporting month is either selected by the users, otherwise the current month is used. Here is a description of the possible relative periods:

- *Reporting month:*

Use this for monthly reports. The month selected in the reporting month parameter will be used in the report.

- *Months/Quarters this year:*

This will provide one value per month or quarter in the year. This is well suited for standard monthly or quarterly reports where all month/quarters need to be listed. Periods that still have no data will be empty, but will always keep the same column name.

- *This year:*

This is the cumulative so far in the year, aggregating the periods from the beginning of the year up to and including the selected reporting month.

- *Months/Quarters last year:*

This will provide one value per month or quarter last year, relative to the reporting month. This is well suited for standard monthly or quarterly reports where all month/quarters need to be listed. Periods that still have no data will be empty, but will always keep the same column name.

- *Last year:*

This is the cumulative last year, relative to the reporting month, aggregating all the periods from last year.

## Example - relative periods

Let's say we have chosen three indicators: A, B and C, and we have also chosen to use the relative periods 'Reporting month' and 'This year' when we created the report table. If the reporting month (selected automatically or by the user) is for example May 2010, the report table will calculate the values for the three selected indicators for May 2010 (= the 'Reporting month') and the accumulated values for the three selected indicators so far in 2010 (= so far 'This year').

Thus, we will end up with six values for each of the organisation units: "Indicator A May 2010", "Indicator B May 2010" "Indicator C May 2010", "Indicator A so far in 2010", "Indicator B so far in 2010" and "Indicator C so far in 2010".

## Report parameters

Report parameters make the reports more generic and reusable over time and for different organisation units. These parameters will pop up when generating the report table or running a report based on the report table. The users will select what they want to see in the report. There are four possible report parameters, and you can select none, all, or any combination.

- *Reporting month:*

This decides which month will be used when the system is choosing the relative periods. If the box is not checked, the user will not be asked for the reporting month when the report is generated - the current month will then be used.

- *Grand parent organisation unit:*

Select the grand parent of all the orgunit children and grand children you want listed in the report. E.g. a selected region will trigger the use of the region itself, all its districts, and all their sub-districts.

- *Parent organisation unit:*

Select the parent of all the orgunit children you want listed in the report. E.g. a selected district will trigger the use of the district itself and all its children/sub-districts.

- *Organisation unit:*

This triggers the use of this orgunit in the report. No children are listed.

### **Example - report parameters**

Continuing with the example on relative periods just above, let's say that in addition to 'Reporting month', we have chosen 'Parent organisation unit' as a report parameter when we created the report table. When we're running the report table, we will be asked to select an organisation unit. Now, let's say we choose "Region R" as the organisation unit. "Region R" has the children "District X" and "District Y".

When the report is run, the system will aggregate data for both "District X" and "District Y". The data will be aggregated from the lowest level where they have been collected. The values for the districts will be aggregated further to give an aggregated value for "Region R".

Thus, the report table will generate the six values presented in the previous example, for "District X", "District Y" and "Region R".

## **25.2.4. Data element dimension tables**

These tables enable the use of data element categories in report tables. There are two differences from regular report tables. The first is that it is not possible to select crosstab dimensions, as the columns will always be the disaggregations from the category combinations. The other is the actual choice of data. Only one category combination can be added per report, and only data elements from the same category combo can be selected.

Subtotals and the total will also be included in the table, e.g. a gender (male, female) + EPI age(<1, >1) category combo would give the following columns: male+<1, male+>1, Female +<1, female+>1, male, female,<1, >1, total.

### **Selecting data**

#### **Selecting category combinations**

Available data elements	
<input type="text" value="Select category combination"/> <span style="float: right;">+</span>	
EPI-Hepatitis B Immunization Measles Immunization Meningitis Immunization Oral Polio Virus Immunization Penta Immunization Pneumococcus Virus Immunization	
<input type="button" value="Add selected"/>	<input type="button" value="Add all"/>
<input type="button" value="Remove selected"/>	<input type="button" value="Remove all"/>
Selected data elements	

Use the drop down menu to choose category combinations. The data elements using this category combination will be listed. Double click to add to the report, or use the buttons.

## 25.2.5. Report table - best practices

To make the report tables reusable over time and across orgunits they can have parameters. Four types of parameters are allowed; orgunit, parent orgunit (for listing of orgunits in one area), grand parent orgunit and reporting month. As a side note it can be mentioned that we are looking into expanding this to include reporting quarter and year, or to make that period parameter more generic with regard to period type somehow. The ability to use period as a parameter makes the report table reusable over time and as such fits nicely with report needs such as monthly, quarterly or annual reports. When a report is run by the user in DHIS2, the user must specify the values for the report tables that are linked to the report. First the report table is re-generated (deleted and re-created with updated data), and then the report is run (in the background, in Jasper report engine).

Report tables can consist of values related to data elements, indicators or data completeness, which is related to completeness of reporting across orgunits for a given month. Completeness reports will be covered in a separate section.

There are three dimensions in a report table that identify the data; indicators or data elements, orgunits and periods. For each of these dimensions the user can select which metadata values to include in the report. The user must select one or more data elements or indicators to appear in the report. The orgunit selection can be substituted with a parameter, either one specific orgunit or an orgunit parent (making itself and all its children appear in the report). If one or more orgunits are selected and no orgunit parameter is used, then the report is static with regard to which orgunits to include, which in most cases is an unnecessary restriction to a report.

### Using relative periods

The period selection is more advanced as it can in addition to specific periods like Jan-09, Q1-08, 2007 also contain what is called relative periods. As report usually is run routinely over time a specific period like Jan-09 is not very useful in a report. Instead, if you want to design a monthly report, you should use the relative period called Reporting Month. Then you must also include Reporting Month as one of your report parameters to let the system know what exactly is the Reporting Month on the time of report generation. There are many other relative periods available, and they all relate to the report parameter Reporting Month. E.g. the relative period called So far this year refers to the accumulative value for the year incl. the Reporting Month. If you want a trend report with multiple periods in stead of one aggregated period, you can select e.g. 'Months this year', which would give you values for each month so far in the year. You can do a similar report with quarters. The idea is to support as many generic report types as possible using relative periods, so if you have other report needs, please suggest new relative periods on the mailing list, and they might be added to the report table options.

### Cross-tabbing dimensions

Cross tabbing is a very powerful functionality in report design, as the typical DHIS2 data table with references to period, data element/indicator and orgunit makes more advanced report design very difficult, as you cannot put e.g. specific indicators, periods or orgunits on specific columns. E.g. by cross-tabbing on the indicator dimension in an indicator report table you will get the indicator names on the column headers in your report, in addition to a column referencing orgunit, and another column referencing period. With such a table design you could drag and drop indicator names to specific columns or chart positions in the iReport software. Similarly you can cross tab on orgunits or periods to make their names specifically available to report design. E.g. by cross-tabbing on periods and selecting the two relative periods 'Reporting month' and 'This year', you can design reports with both the last month and the accumulative

annual value for given month as they will be available as column headers in your report table. It is also possible to combine two dimensions in cross-tabbing, e.g. period and indicator, which makes it possible to e.g. look at three selected indicators for two specific relative periods. This would e.g. make it possible to make a table or chart based report with BCG, DPT3 and Measles coverage, both for the last month and the accumulative coverage so far in the year.

All in all, by combining the functionality of cross tabbing, relative periods and report table parameters you should have a tool to support most report scenarios. If not, we would be very happy to receive suggestions to further improvements to report tables. As already mentioned, we have started to look at more fine-grained parameters for the period dimension as the 'Reporting month' does not cover enough, or at least is not intuitive enough, when it comes to e.g. quarterly reports.

## 25.3. Report table outcome

When the report table is run, the system will calculate values for specified indicators/data elements/data sets, orgunits and periods. The data will be presented in DHIS2 in a table layout. The column headers will correspond to the cross-tab dimension you have selected. An example report table showing ANC coverage for a district in The Gambia, is shown below. Here the indicator and the periods are cross-tabbed, as can be seen from the column headers.

### Example report table

Organisation unit	ANC coverage February 2010	ANC coverage 2010
Jappineh Village OPD	0.0	0.0
Jappineh PHC Circuit	0.0	0.0
Jarra Central District	0.0	0.0

Above the table there are six buttons; five download buttons and one Back button. Clicking the Back button will simply take you back to the previous screen. The function of the five download buttons, are presented below the screenshot:

### The download buttons

### The five download buttons

- *Download as Excel:*

Downloads a generated Excel file you can open in Excel.

- *Download as CSV:*

Downloads a generated .csv file. CSV stands for **Comma Separated Values**. It's a text file with the file ending .csv. Each line in the file corresponds to a row in the table, while the columns are separated with semi colons (;). The file can be opened in a text editor as well as in a spread sheet program (such as Excel).

- *Download as PDF:*

Downloads a generated PDF file. The data will be presented in a similar layout as the generated table you are already viewing in DHIS2.

- *Download as Report:*

Downloads a "styled" PDF file. In addition to present the data in a table layout, this file also presents a chart, showing the aggregated data from all the chosen periods and the parent

organisation unit chosen for the report table. The report is generated using the Jasper report engine.

- *Download as JRXML:*

Downloads the design file for the generated Report described in the previous bullet. The design file (with the file ending .jrxml) can be opened in the Jasper iReport Designer software. If you plan to design standard reports, this is the starting point.

## 25.4. Standard reports

### 25.4.1. What is a standard report?

A standard report is a manually designed report that presents data in a manually specified layout. Standard reports can be based either on report tables or SQL queries. Both approaches are described in the following sections. The main advantage of using report tables is that of simplicity - no special development skills are required. In cases where you have special requirements or need to utilize additional parts of the DHIS2 database you might want to use a SQL based standard report. In any case you will be able to utilize report parameters in order to create dynamic reports. The following guide will use the report table approach, while the SQL approach is covered towards the end.

### 25.4.2. Designing Standard reports in iReport

Jasper iReport Designer is a tool for creating reports that can be used as Standard Reports in DHIS2. The tool allows for the creation of standard report templates that can easily be exported from DHIS2 with up to date data. The process of creating reports involves four major steps:

1. A report table must be created in DHIS2 with the indicators/data elements/datasets to be used in the report.
2. You have to run the report table and download the design file (Click the "Download as JRXML" button).
3. Open the downloaded .jrxml file using the free software Jasper iReport Designer to edit the layout of the report.
4. The edited report can then be uploaded to DHIS2 to be used as a standard report.

If you want to preview your report during the design in iReport, you actually have to upload your file to DHIS2 to see how it looks.

These four steps will be describe in detail in the coming sections. In general, when you are making standard reports you should have a clear idea of how it should look before you even make the report table, as how the report table is designed has implications for how the report can be formatted in iReport. For example, what crosstab dimensions are selected in the report table has consequences for what crosstabs are available for the standard report, and it has consequences for what types of charts you can make.

#### 25.4.2.1. Download and open the design file

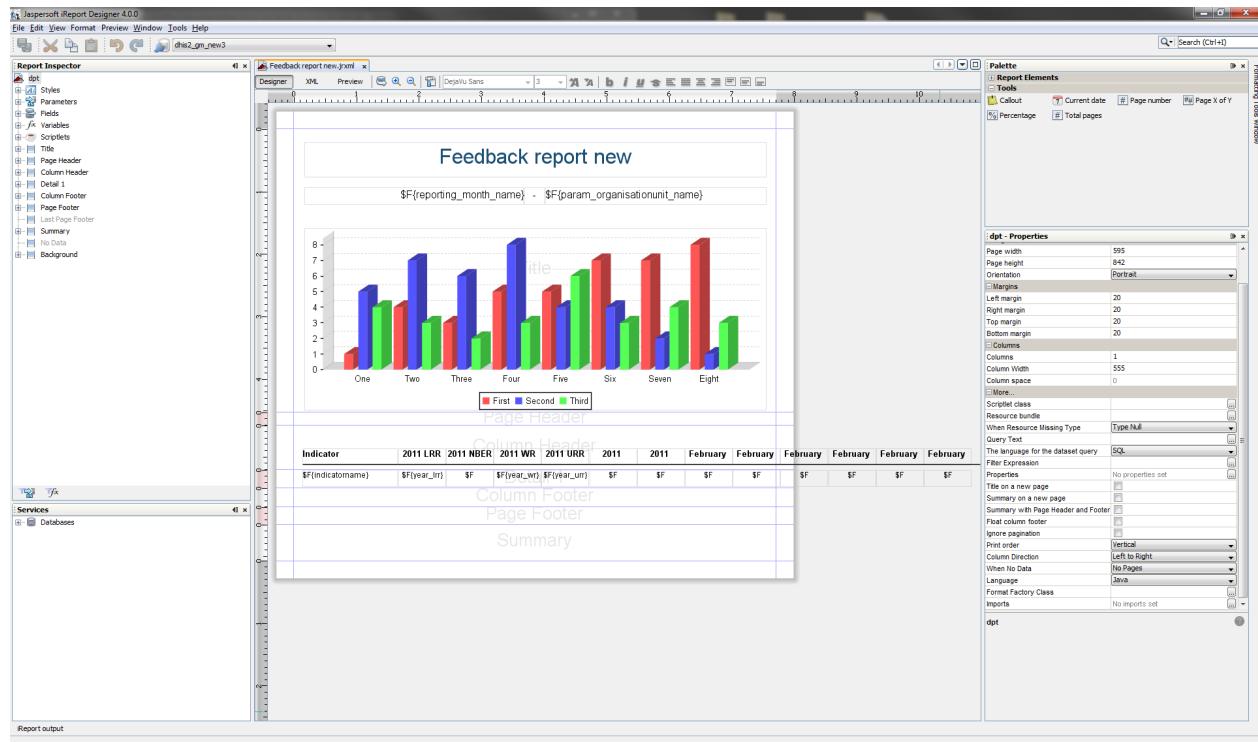

*Note: If you have not created a report table yet, you have to do so. See section "How to create report tables" to do so.*

Locate your desired report table and run it by clicking the green circle with a white arrow inside. When the report is shown, click the "Download as JRXML" button to download the design file. Then open that file in the Jasper iReport Designer software.

## 25.4.2.2. Editing the report

You are now ready to edit the layout of the report. The main iReport window consists of a "Report Inspector" to the left, the report document in the middle, a "Palette" area on the upper right hand side and a "Properties" area on the lower right hand side. The "Report Inspector" are used for selecting and examining the various properties of the report, and when selecting an item in the inspector, the "Properties" panel changes to display properties relating to the selection. The "Palette" is used for adding various elements, e.g. text boxes, images and charts to the document.

### Overview of the main iReport window

*Note: If you cannot see the Palette or Properties sidebar, you can enable them from the menu item called "Window" on the menu bar.*

The iReport document is divided into seven main bands, divided by layout separators (the blue lines). These lines are used to decide how big each of the areas should be on the report.

The areas all have different purposes:

- Title - area for the title of the report
- Page header - area for the page header
- Column header - area for column headers (for the table)
- Detail 1 - area where the actual report data will be placed
- Column footer - area to make footer of the table
- Page footer - area for the page footer
- Summary - elements in this area will be placed at the end of the report

By default you will see that only the Title, Column Header and the Detail 1 bands have data. For most reports this is OK. The Title band is suitable for a title and e.g. a chart. Data fields entered into the Detail 1 area will be iterated over to create a table. For example, if a field called "dataelementname" is placed in the Detail 1 band, all data elements in the report table will be listed here. We'll come back to data fields management just a little below.

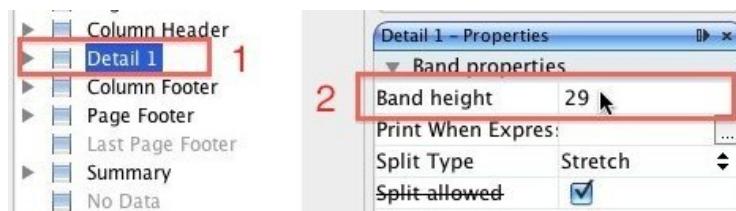

The unused bands in the report are shrunked to add more space for your report data. You can however increase/decrease the band height as you like. There are two ways to do that. The first way is simply to drag the blue band-line as shown below.

### Drag the blue lines to change the band heights

The other way to adjust the band height is to select a band in the "Report Inspector", and then adjust the "Band height" value in the "Detail 1 - properties" area in the lower right corner.

### Adjust the size of layout areas by changing the Band height property

As the fields are already present on the report, you probably don't want to do anything than just fix the layout and drag fields around. You can also resize the fields by dragging the side, top or bottom lines. If you want to change the text in the column headers, you simply double click the field and change the text.

To add the a field to the table, we simply drag it to the Detail 1 band from the "Report Inspector". The column header will be added automatically.

By double clicking the box, the text can be edited. The format of the text, such as size, font and alignment, can be adjusted with the tools above the document.

### Double click to edit the text, and change its appearance

**NOTE: Fields starting with "\$F" present values that are retrieved from the database every time the report is run. The values here will vary, so do not change these fields unless you want a static value here!**

## 25.4.2.3. Text

There are two types of text in iReport: «Text labels» and «Text fields» (data fields). They work in different ways, and should be used for different purposes. The main point is that text fields are just placeholders that will be filled with the correct text from the report table when the report is run, while text labels will stay the way they are when the report is run.

### 25.4.2.3.1. Static text

Static text are text plain text labels that can be edited normally. There are two ways to edit text labels:

- By double clicking in the text box
- By using the Static text properties in the Properties panel

#### Click to edit text label

### 25.4.2.3.2. Text fields

Text fields are formulas that will be filled from the report table when the report is run. Unlike static text, these can not be edited in a normal way. However, they can be manipulated in various ways to ensure that the desired output will be produced. There are three ways to edit the text fields:

- By right clicking on the text box and selecting Edit expression
- By double clicking the text field (not recommended, as this will not bring up the expression editor)
- By using the Text field properties in the Properties panel

#### Click to open Expression editor

#### Click to open Expression editor

Text fields can represent either numbers or text, so that they can be used both for showing for example names of district or for numeric values. It is therefore important the Expression class, seen in the Text field properties matches the Text field expression. For the default text fields in the .jrxml file downloaded from DHIS2 this is not a problem, but it is important when making new text fields. The two most important Expression classes are java.lang.Double for numbers and java.lang.String for text.

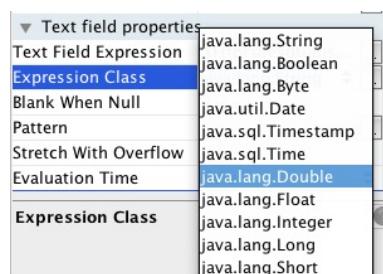

#### 25.4.2.3.2.1. Example

For example, let us say you have a quarterly report where you would like to add a new column with the yearly total. You therefore add a new Static text field to the column header band, and a Text field to the details band in. By default, new Text fields are set to java.lang.String (text). However, the yearly total column will be filled with numbers. We therefore have to change the Expression class for the new text field to java.lang.Double:

#### Click to show expression class options

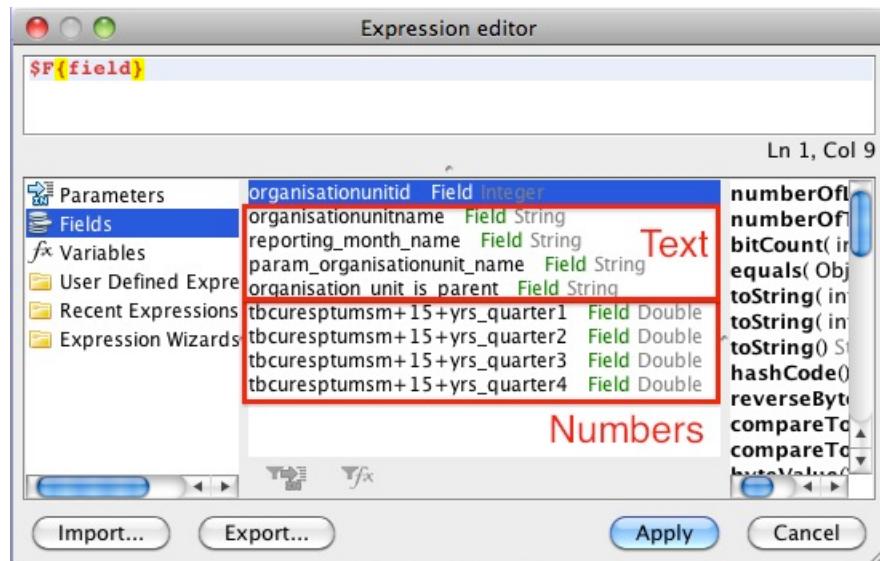

#### Choose desired class

When we edit the text field expression, we see the Expression editor window with all the available columns from the report table. We can see here that each of these are marked with what type they are - text or number. What we need to make sure of is therefore that the expression class we choose for the text field matches the actual expression.

### Expression editor

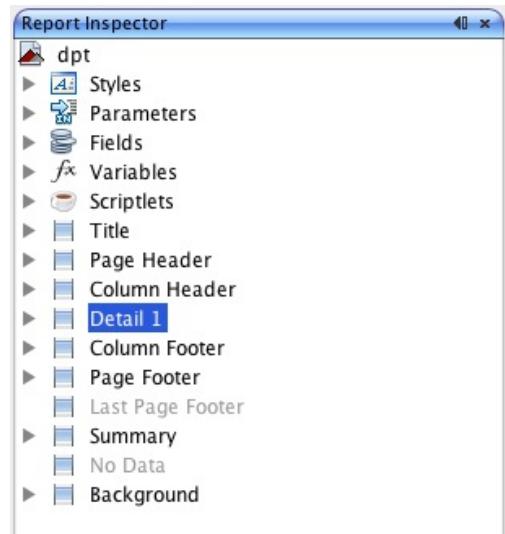

#### 25.4.2.4. Filtering the table rows

In the default table exported from DHIS2, there are some rows that it might be better to leave out of the table, and some that it would be preferable to have at the end. For example, when making a table based on a report table with the «parent organisation unit» parameter, the default table might have a row with the national level somewhere in between all the regions. In iReport, this can be changed so that the «parent organisation unit» appears at the bottom of the table. This involves two steps that will be explained below. Note that this will not work where there is only one organisation units, and it is therefore most useful when using the «parent organisation unit» or «grand parent organisation unit» parameters in the report table.

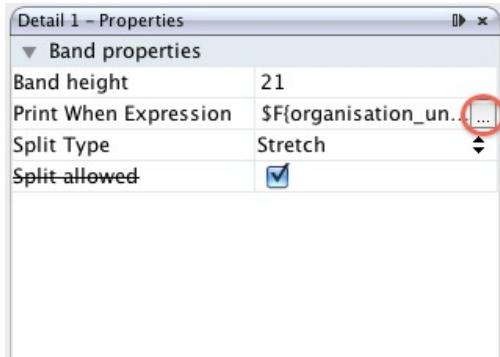

##### 25.4.2.4.1. Hiding the «parameter organisation unit» from the table

We exclude the "parameter organisation unit" from the table by using a property in the Details band called "Print when expression". To set a Print when expression, start by selecting the Detail band in the Report inspector, then edit the Print when expression in the properties panel.

##### Select Detail 1 in the Report Inspector

## Open the Expression Editor by clicking next to Print When Expression

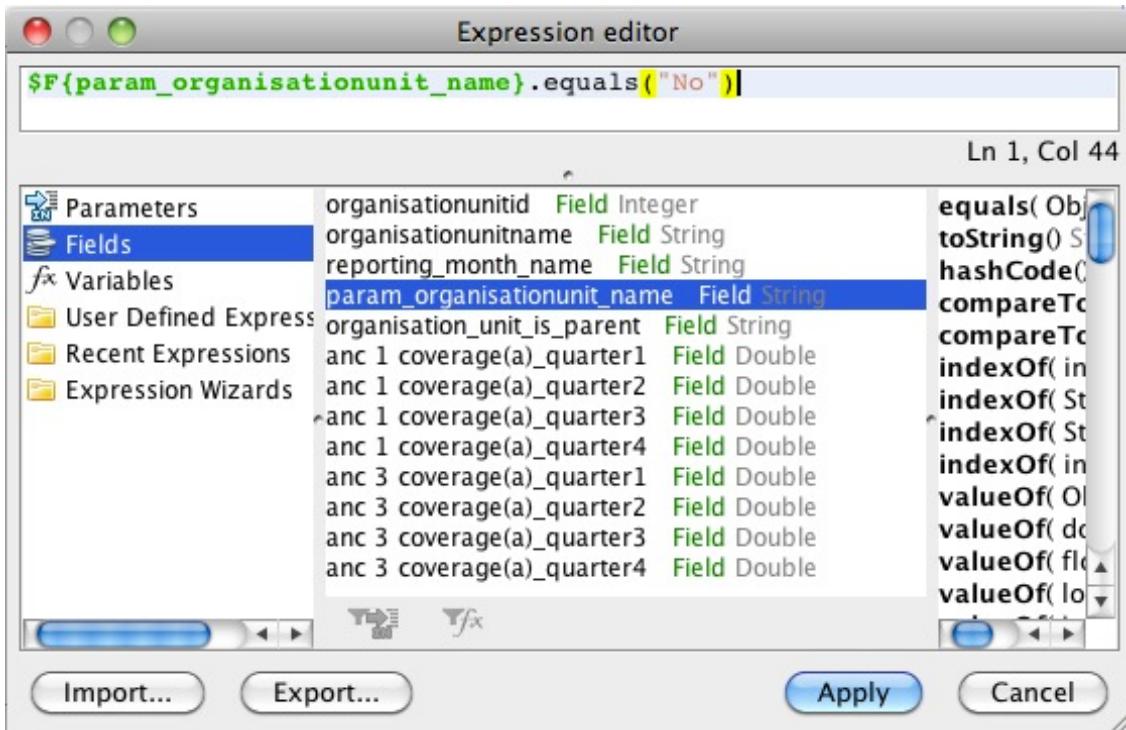

The Expression editor window should now appear. What we must do is to create an expression that checks if the row being generated is the row with the organisation unit given as a parameter. The report table contains a column that we can use for this called organisation\_unit\_is\_parent. To exclude the row with the parameter organisation unit, double click on organisation\_unit\_is\_parent in the list to copy it to the expression area, then add .equals("No") at the end so that the code is:

```
$F{organisation_unit_is_parent}.equals("No")
```

This tells the report engine to only print table rows where the organisation unit is not the parent organisation unit.

### Code to skip parent organisation unit

#### 25.4.2.4.2. Putting the "param organisation unit" at the bottom of the table

Instead of removing the "param organisation unit" from the table entirely, it is also possible to put it at the bottom (or top) of the table. This is done by using the sort functionality explained in the next section, and choosing to sort first by "organisation\_unit\_is\_parent". Other sorting options can be added in addition to this, for example to make a list where the param organisation unit is at the bottom of the table, with the other organisation units listed alphabetically above it.

### 25.4.2.4.3. Hiding other rows

Using the expression editor it is also possible to exclude other rows from the table, in addition to the parent organisation unit as was explained above. In Ghana, for example, all regions have a «fake district» which is the name of the region in square brackets. This can also be excluded from the table using the Print when expression that was introduced above. To do this, follow the instructions above to bring up the Expression editor window. Then, we use Java expressions to test whether or not the row should be hidden.

#### 25.4.2.4.3.1. Example - removing rows with organisation units starting with [

Example - removing rows with organisation units starting with [

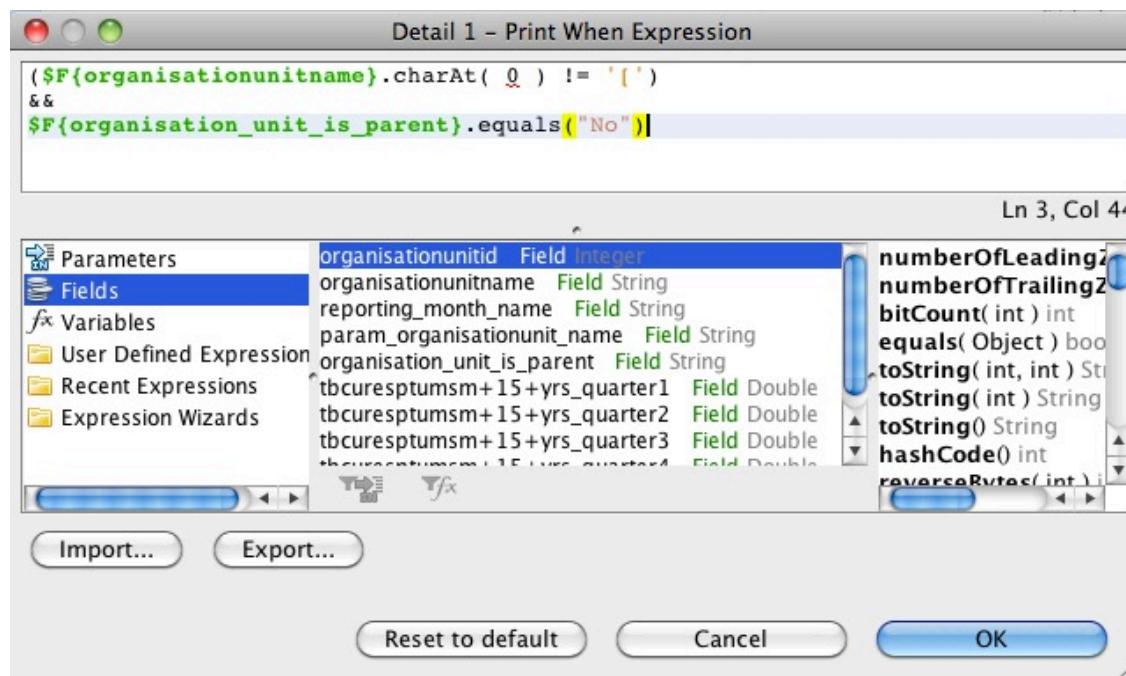

```
($F{organisationunitname}.charAt( 0 ) != '[')
```

This makes the report skip any rows where the first character of the organisation unit name is [.

It is also possible to combine several of these expressions. To do this we put the expressions in a parenthesis with the two characters && in between. For example, to make a table that leaves both organisation units whose name starts with [ and the parent organisation unit, we can use the following expression:

```
($F{organisationunitname}.charAt( 0 ) != '[') &&
$F{organisation_unit_is_parent}.equals("No")
```

#### Combining expressions in the Expression editor

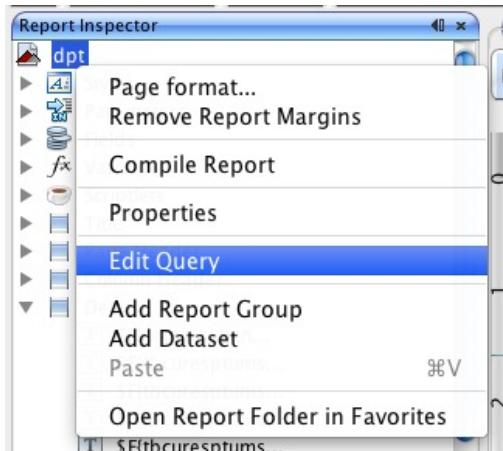

### 25.4.2.5. Sorting

Often you will be making reports where the first column is organisation unit names. However, it can be a problem that the list of organisation units are not sorted alphabetically. This can be fixed in iReport through a few simple steps.

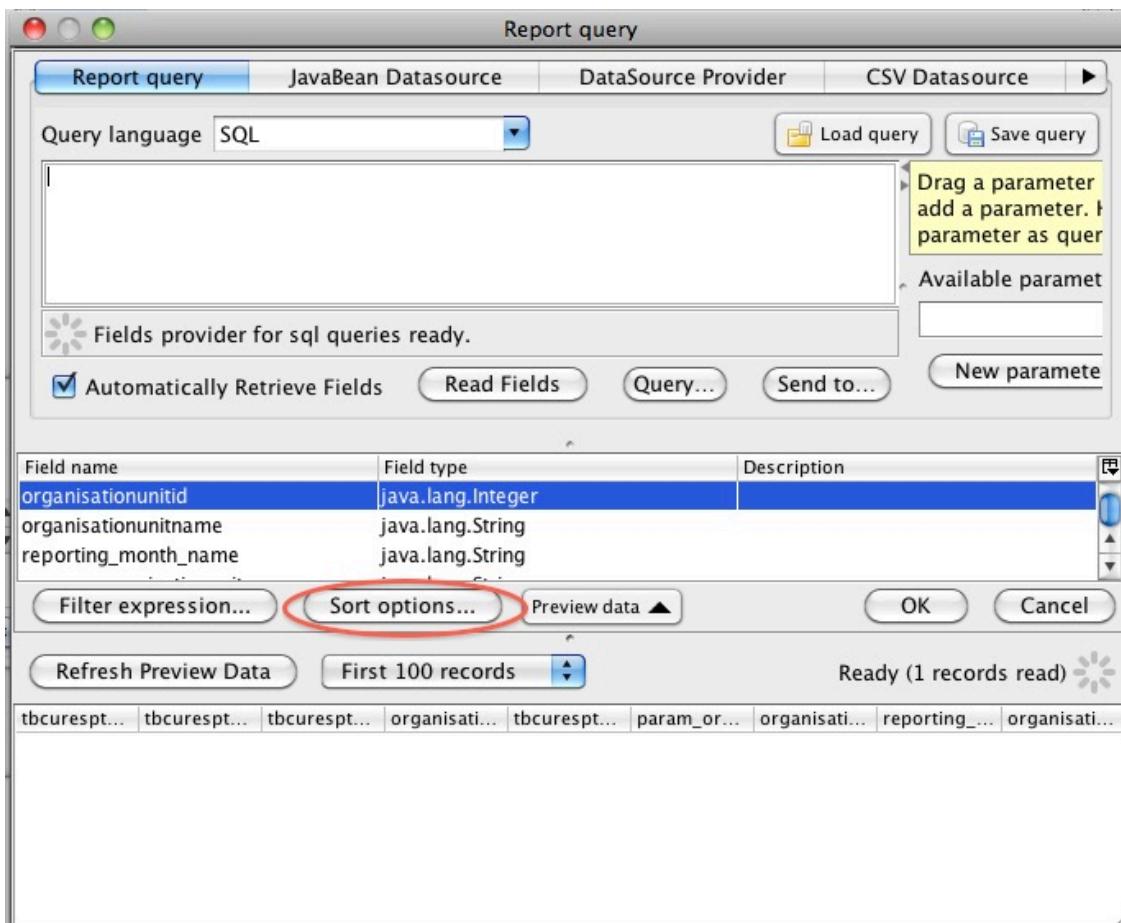

In the report inspector, right click on the name of the report (by default this is dpt) and select Edit query.

## Choose Edit Query

A Report query window will appear. Click on the Sort options button.

## Choose Sort Options...

A Sorting window as show below will appear. Here, we can add our sorting options. Click the Add field button. Another small window will show up, with a drop down menu where you can choose Sort by organisationunitname to have the table sorted alphabetically by name.

## Choose Add

## Choose sort parameter

Click OK - Close - OK to close the three windows. The table should now be sorted.

### 25.4.2.6. Changing indicator/data element names

By default, the reports from DHIS2 uses the short names for indicators and data elements in reports and charts. In some cases these are not always very meaningful for third parties, but with some work they can be given custom names through iReport. This is useful for example if you are making a report with indicators as rows and periods as column, or for charts with indicators.

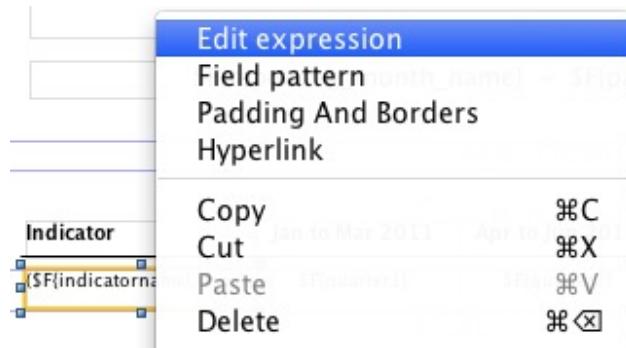

#### Shortnames - before and after

Indicator	Jan to Mar 20	Indicator	Jan to Mar 20
Bed Util All		Bed Utilisation - All Wards	
Bed Util Mat		Bed Utilisation - Maternity	
Bed Util Ped		Bed Utilisation - Paediatric	

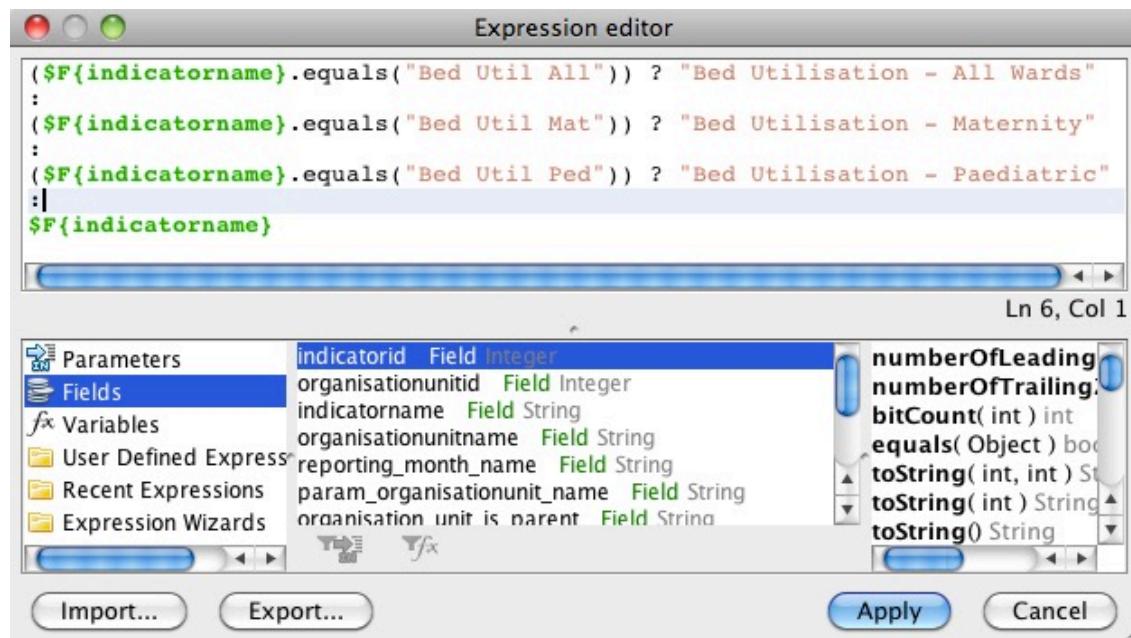

To change the names of an indicator or data element, we have to edit its «expression» or formula, for example by right clicking the text box and choosing Edit expression to bring up the Expression editor.

## Choose Edit Expression

Next, we have to insert some Java code. In the following example, we will be replacing the shortname of three indicators with their proper names. The code searches for the shortname, and then replaces it with a proper name.

### Expression editor, showing replacing shortnames

```

($F{indicatorname}.equals("Bed Util All")) ? "Bed Utilisation - All Wards"
:
($F{indicatorname}.equals("Bed Util Mat")) ? "Bed Utilisation - Maternity"
:
($F{indicatorname}.equals("Bed Util Ped")) ? "Bed Utilisation - Paediatric"
:
$F{indicatorname}

```

From this, we can see a pattern that is reusable for more general cases.

- For each indicator or data element we want to change the name for, we need one line
- Each line is separated by a colon :
- We finish the expression with a «regular» line

Each line has the same format, where the red text is the shortname, the blue text is what we want to insert instead.

## Code for replacing shortnames. Shortname in red, new name in blue

```
(${F{indicatorname}.equals("Bed Util ALL")) ? "Bed Utilisation - All Wards"
```

The same expressions can be used for example when having indicator names along the category axis of a chart.

### 25.4.2.7. Adding horizontal totals

By using the expression editor, it is possible to add a column to the table with totals for each row. In the following example, we will make a table with three months as columns as well as a column with the totals for the three months.

We start by dragging a text label into the table header and changing its text to "Total", and dragging a text field into the details row.

As was discussed in the section on "Text field", we have to change the properties of the new text field so that it can display numbers. To do this, change the "Expressions Class" in the properties panel to "java.lang.Double".

Right click the text field and choose "Edit Expression". This will bring up the "Expressions editor". As the expression, we want to sum up all the columns. In this case we have three value expressions we want to sum up: "September", "October 2010", "November 2010". The name of these fields will vary depending on the crosstab dimension you have chosen in the report table. In our case, the expression we make is "\${f{September}}+\${f{October 2010}}+\${f{November 2010}}":

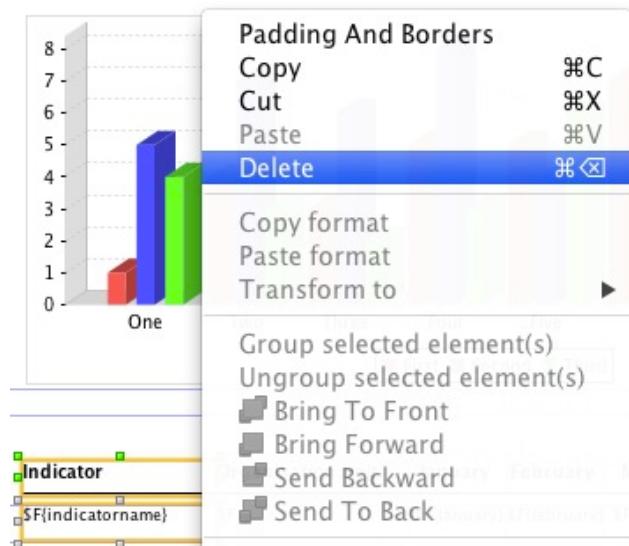

Each row of the table have a totals column to the right.

### 25.4.2.8. Groups of tables

There are cases when it can be useful to have several tables in one report. This can be done using Report groups. Using this functionality, one can for example create a report one table for each indicator, or one table of each organisation unit. In the following, we will go through the steps needed to make a report with three indicators, each represented in one table. It is important that the report table does not crosstab on indicators when we want to make groups of tables based on indicators.

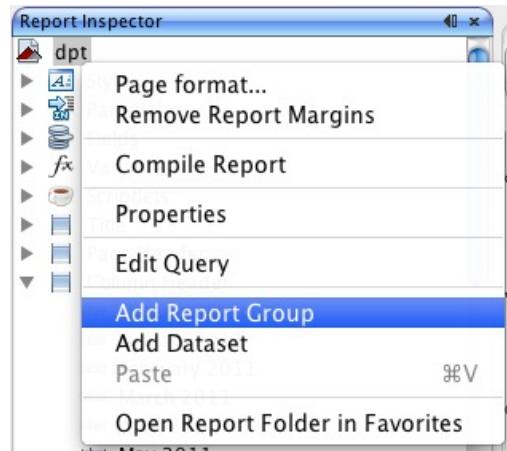

In our example, the .jrxml file downloaded from DHIS2 will by default have one column for organisation unit and one for indicators (assuming we have chosen periods as the only crosstab dimension). We start by removing the indicator column, since this is not needed in our case, and realign the other fields to fit the report.

#### Delete column

Next, we create our Report group. Go to the report inspector, right click on the report name (dpt is the default) and choose Add Report Group.

### Add Report Group

A window will appear, with a report group wizard. Select a name for the group, in this case we choose «Indicator». In the drop down menu, we can select what columns in the report table we want the groups to be based on. So, if we wanted one table for each organisation unit, we would choose organisation unit name as the report object to group according to. However, since we are grouping by indicators in this example, we choose indicatorname. Then click next.

### Choose grouping parameter - here, indicators

The next step is to select whether or not we want a separate Group header and Group footer band for each report group. In this case, we choose to include both. Click Finish, and the group bands should appear in the report.

## Add group header/footer

If you upload and run the report, it will now create one table for each indicator. However, it will not look very good as there will be no header row over each table - only one header at the top of each page. Also, there is no indication as to which table is showing which indicator. In the following, we will fix this.

Instead of having the title row in the column header, we can instead move it to the Group header. This will make the heading show up above each individual table. Furthermore, we can add a heading to each table with the name of the indicator.

Move the column headers from the Column header band to the Indicator group header band.

### Move header row to column header

Next, add a text field to the Indicator group heading band, and edit its expression to display the indicator name.

### Add text field to use as heading

## Edit text field expression to show indicator name

The report should now have three tables, one for each indicator. Each table will have a heading with the name of the indicator, and also a table header row.

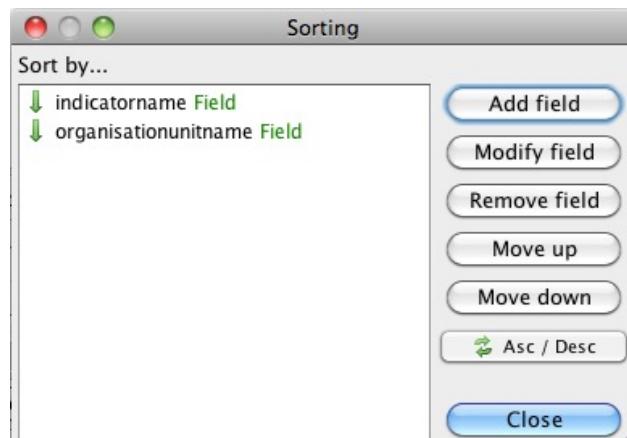

### Example of finished report table

EPI BCG coverage												
	Jan	Feb	Mar	April	May	June	July	Aug	Sept	Oct	Nov	Dec
Ashanti												
Central												
ZR												
Eastern												
Upper West												

#### 25.4.2.8.1. Sorting and grouping

When using grouping, some precautions must be taken with regards to sorting. Notably, when adding sorting parameters, whatever parameter is used as basis for the grouping must come first. Thus if you are grouping the report by indicator, and want sort the organisation units alphabetically, you have to choose to sort first by indicator, then by organisation unit name as shown below. For instructions on how to add sorting, see the sorting section above.

### Sorting by indicator and organisation unit name

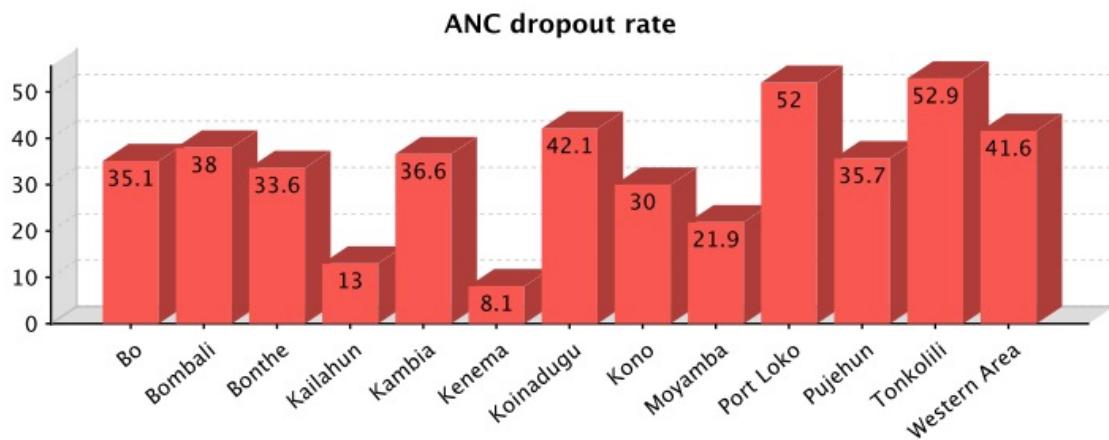

## 25.4.2.9. Charts

By default, a 3D bar chart is included in the .jrxml file that is downloaded from DHIS 2. This is set up so that only data from the «parameter organisation unit» (often the parent or grand parent) is used. Usually, this is a good solution. Since it is the default, we will start by looking at bar charts, before looking at line charts.

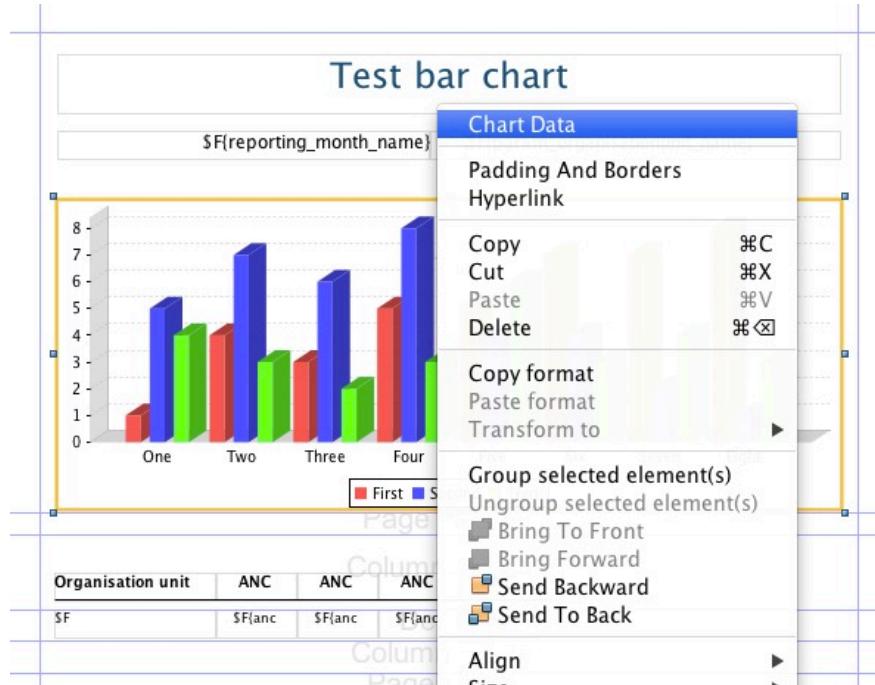

### 25.4.2.9.1. Bar charts

#### Example bar chart

Bar charts are the default chart type in DHIS2. In this section, we will look at how to make a bar charts like the one above, comparing the value of one indicator in several districts. To edit the default chart in iReport, right click on it and choose Chart data.

#### Choose Edit Chart Data

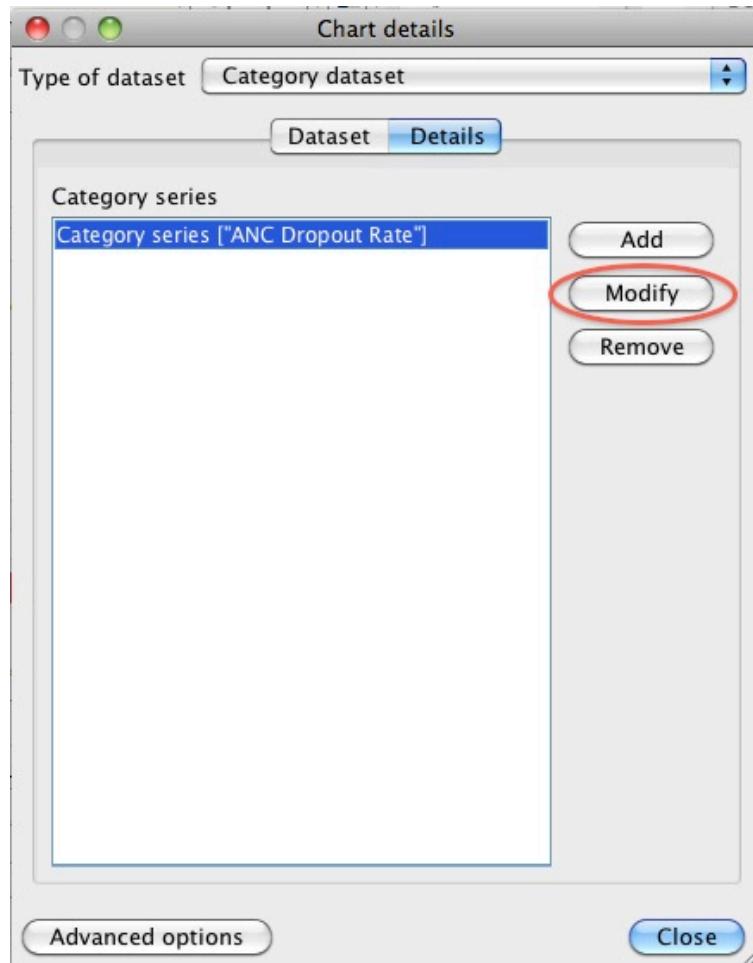

A window will appear. By default, the Filter expression is filled in so that only data for the parent organisation unit will be displayed. If for some reason you do not want this, simply delete the text in the text box. In this case we do NOT want the filter, as we are making a chart showing a comparison across districts. To continue, click the details tab.

## Select the Details tab

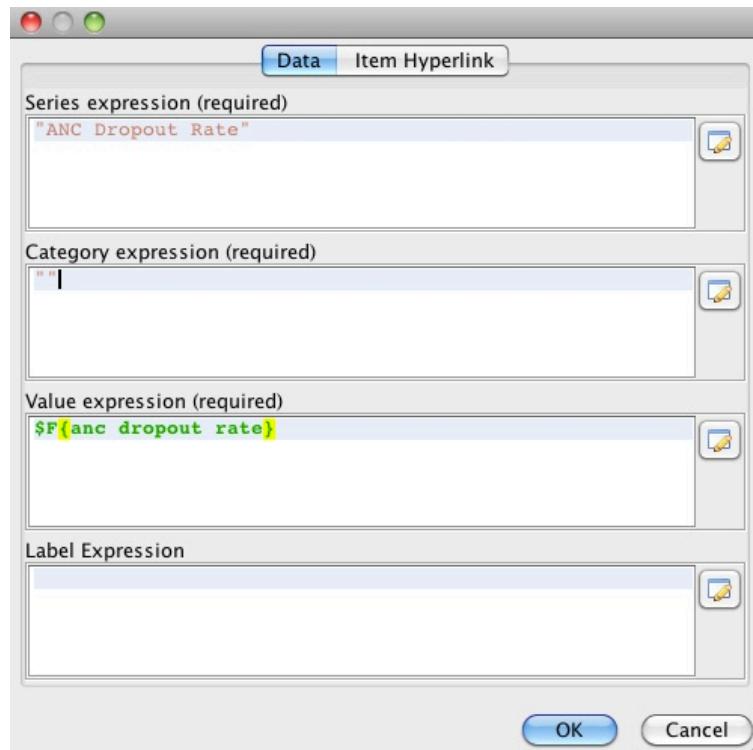

Under details, you see the list of series for the chart. By default, one series is created per crosstab column. In this case, we are looking at data for one indicator for the whole of 2010, for a number of districts. The indicator is along the crosstab dimension.

## List of data series

To make changes to a series, select it and click modify. Another window will appear where there are four areas that can be edit. The three first are required, but it is sufficient to add an empty quote («») in one of the first two.

## The data series editor

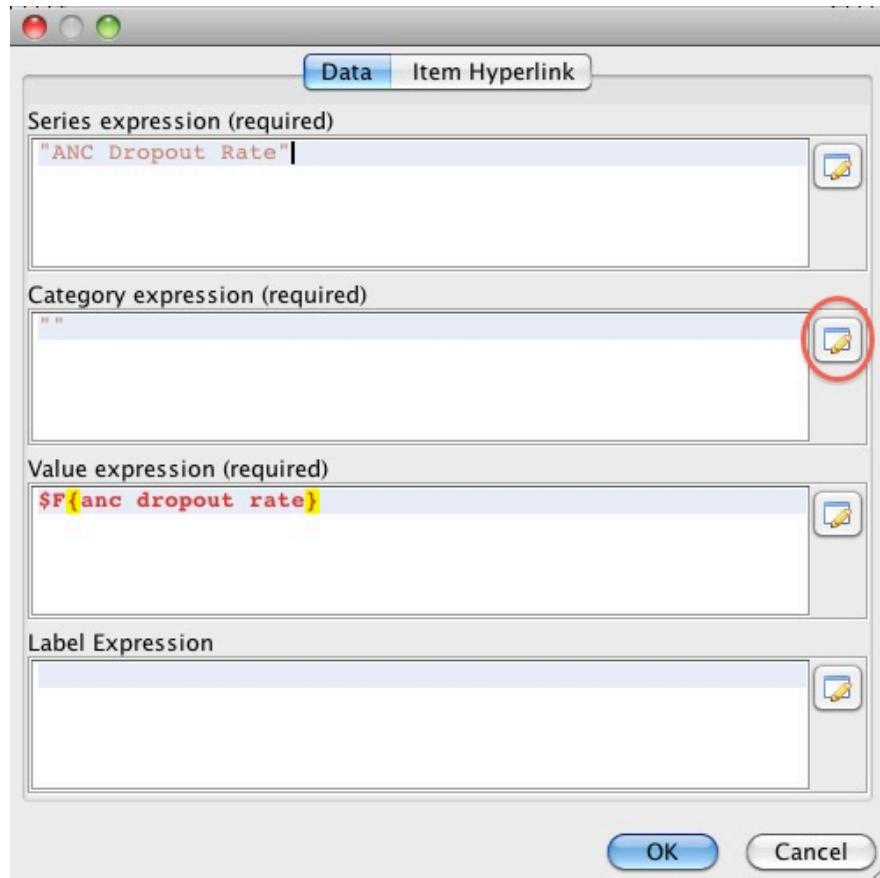

The first box is a text field where the name of the series can be inserted or edited. This is the field that will be used to fill the text in the legend box (shown below).

## Chart legend

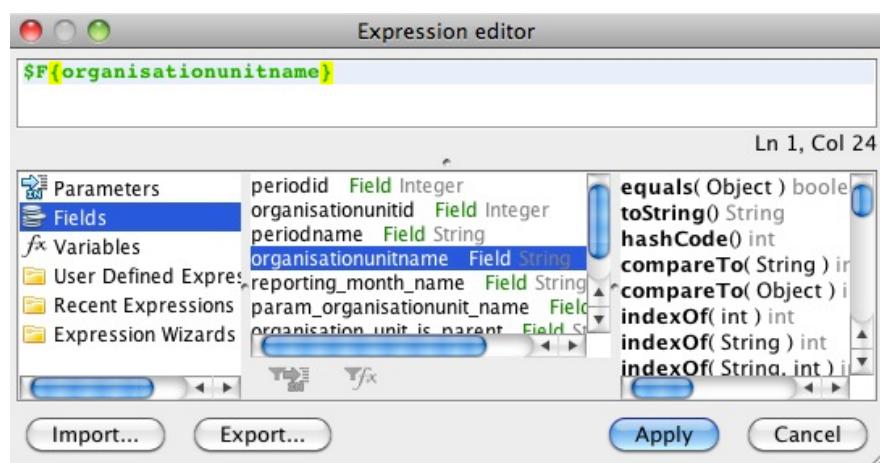

However, if you want to have the name of each bar along the x-axis of the chart instead of using the legend, this can be done by adding whatever text you want to present in the Category expression field, or by inserting an expression to have it filled automatically when the report is run. In this case, we want to have one bar for each organisation unit. We therefore edit the category expression by clicking on the button to the right.

## Editing the category expression

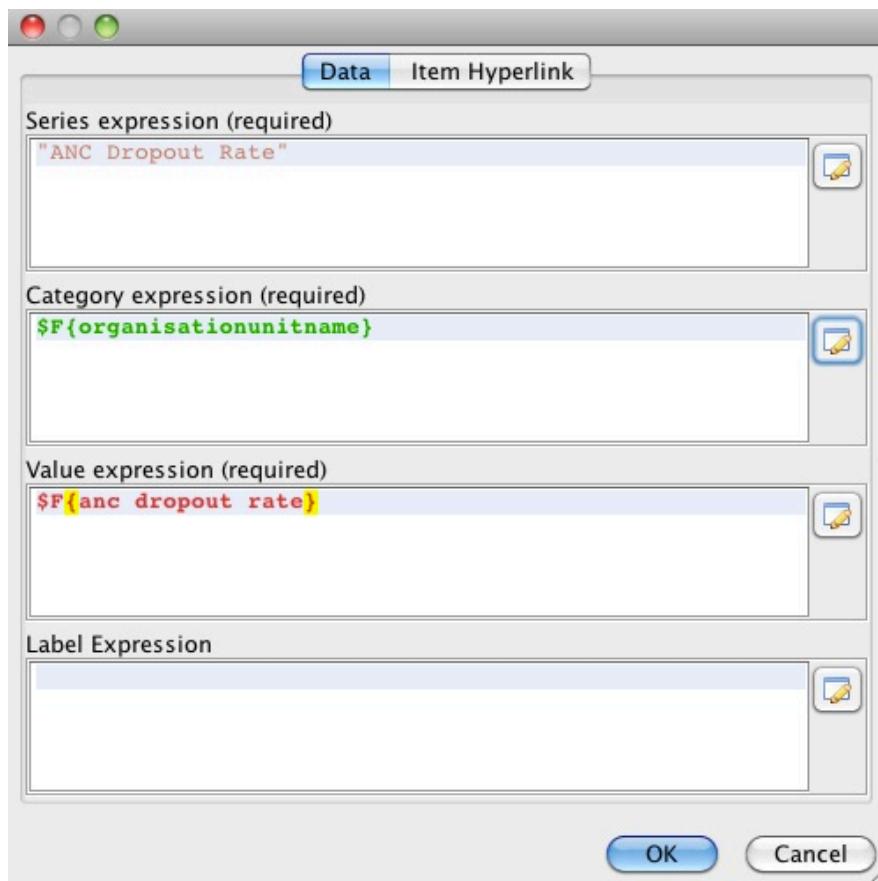

As the expression, we chose organisationunitname, as shown below.

## Choose organisation unit name.

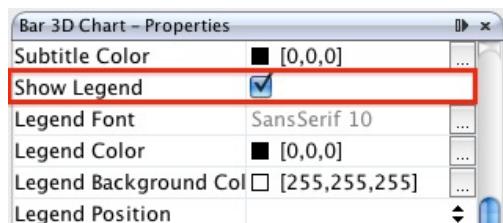

When we are finished, the series editor should look like below. Click OK, then Close to close the Chart Details window.

### Series editor.

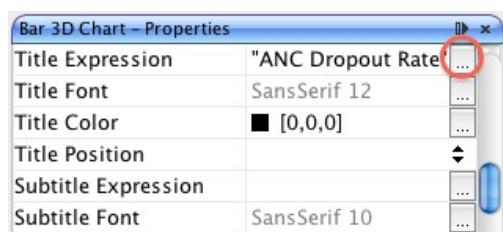

If you add a good description in the Category expression area, you can leave out the legend box. This is done in the Report properties panel of iReport, where you can also edit many other details of the chart.

### Checkbox to show/hide chart legend

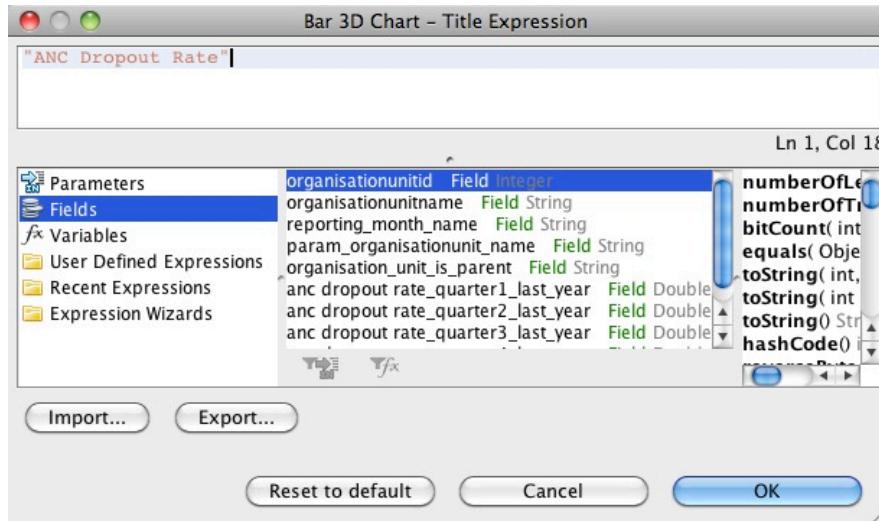

We can also add a title to the chart, for example the name of the indicator. This is also done in the Chart properties panel, under Title expression.

### Edit chart title

The Expression editor window will appear, where you can enter the title. Note that the title must be in quotes, as shown below.

## Expression editor

The chart is now ready.

### 25.4.2.9.2. Line charts

Line charts can be useful in many circumstances. However, to make line charts the report data (report table) must be suited for it. Thus if you want to make a line chart, it is important that the report table does not have periods in the crosstab dimension. Examples where this is useful is if you are making a report for a single organisation unit with one or more indicators, or if you are making a report with one indicator and one or more organisation units.

Below, we will go through the steps needed to make a report with a line chart showing the development of three indicators over one year, for one organisation unit. We start by making a report table with the choices shown below:

#### Report table - crosstab dimensions

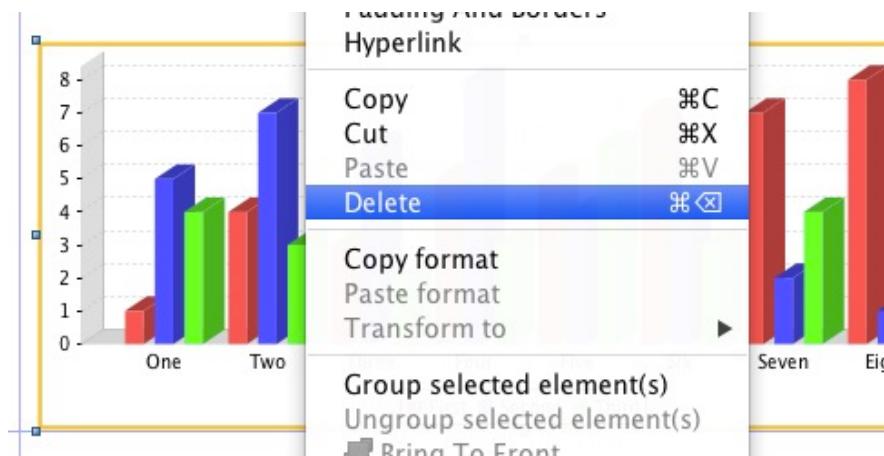

<b>Crosstab dimensions</b>
Indicators / data elements / data sets <input checked="" type="checkbox"/>
Organisation units <input type="checkbox"/>
Periods <input type="checkbox"/>

#### Report table - periods and parameters

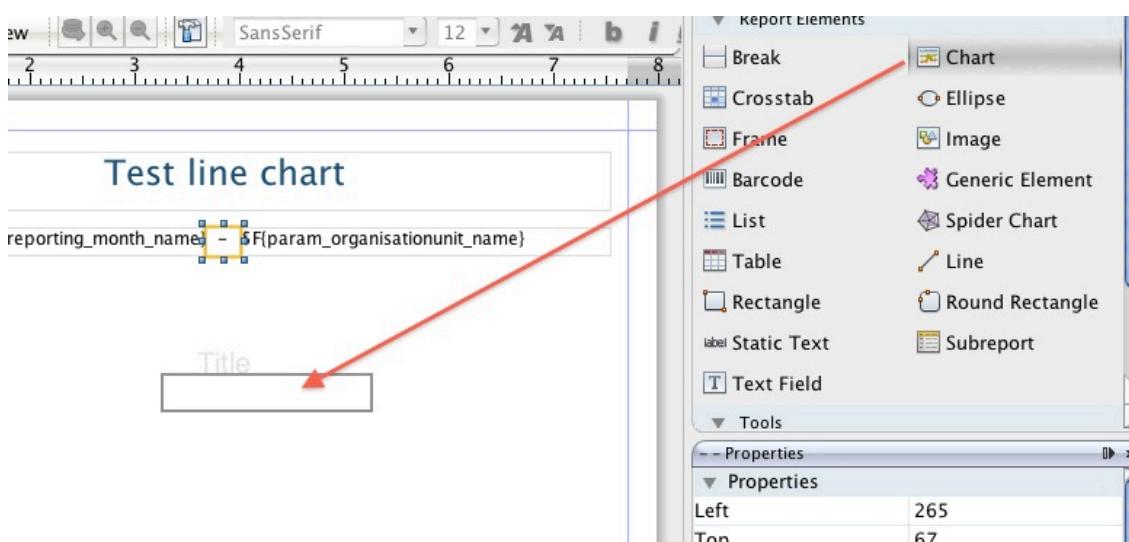

<b>Relative periods</b>
Reporting month <input type="checkbox"/> Months this year <input checked="" type="checkbox"/> Quarters this year <input type="checkbox"/> This year <input type="checkbox"/>
Months last year <input type="checkbox"/> Quarters last year <input type="checkbox"/> Last year <input type="checkbox"/>
<b>Report parameters</b>
Reporting month <input checked="" type="checkbox"/> Parent organisation unit <input type="checkbox"/> Organisation unit <input checked="" type="checkbox"/>

When we open the resulting .jrxml-file in iReport, the default line chart is included. Since we want to make a line chart, we delete this chart and drag a new chart element into the report from the Palette panel.

## Delete the default chart

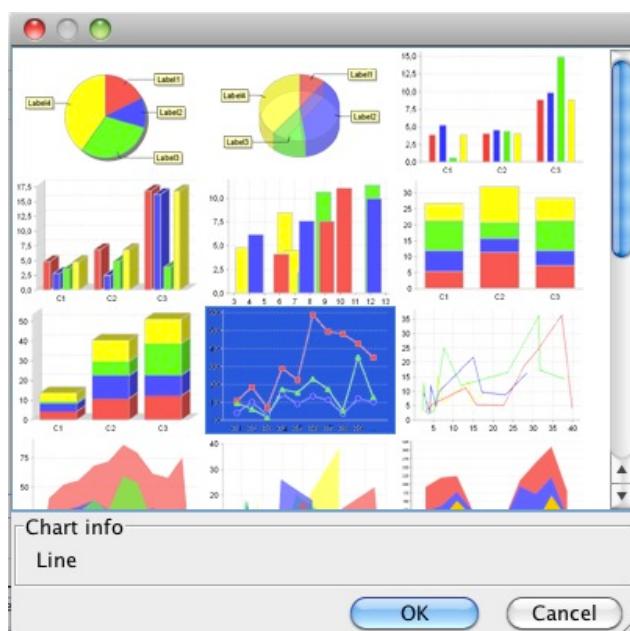

## Drag in new chart element

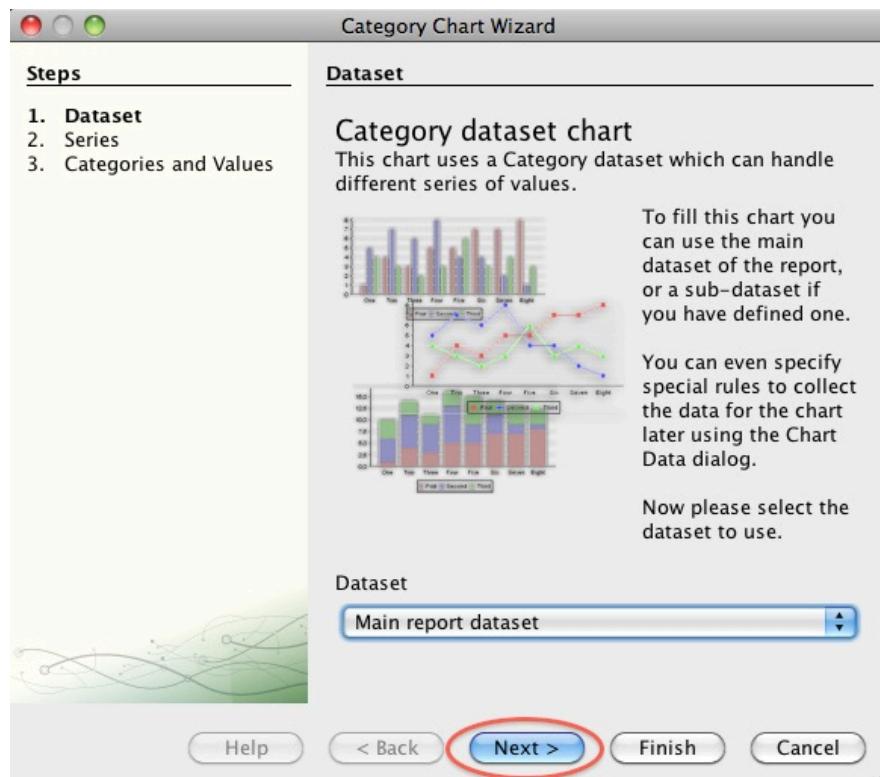

As soon as we drag the Chart element into the report, a window will appear. We choose the Line chart, as shown below.

## Choose Line chart

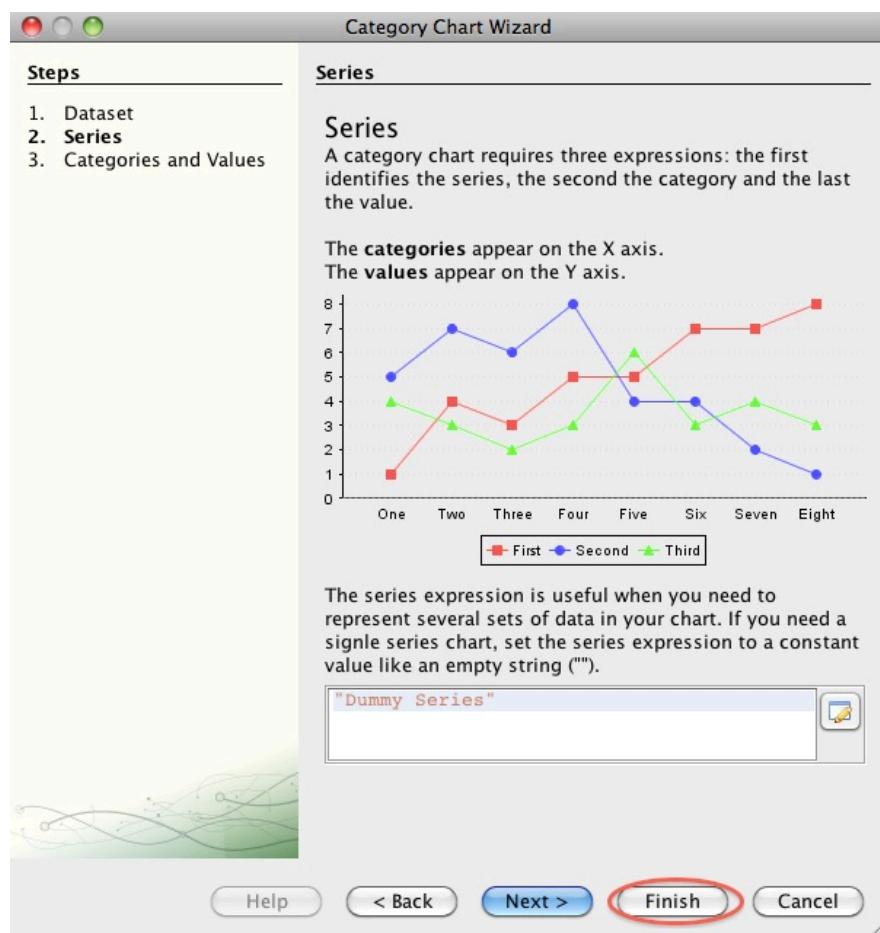

A chart wizard will appear. Click next in the first step, then Finish in the next - we will add the data later.

## Choose Next

## Choose Finish

Next, adjust the size and position of the chart in your report. Then, we will add one data series for each of our three indicators. Right-click on the chart and choose Chart data. If you are making a chart with one indicator and several organisation units, you probably want to make a filter expression so that only data from the parameter/parent organisation unit is used in the chart. To do this, add this line to the Filter expression area:

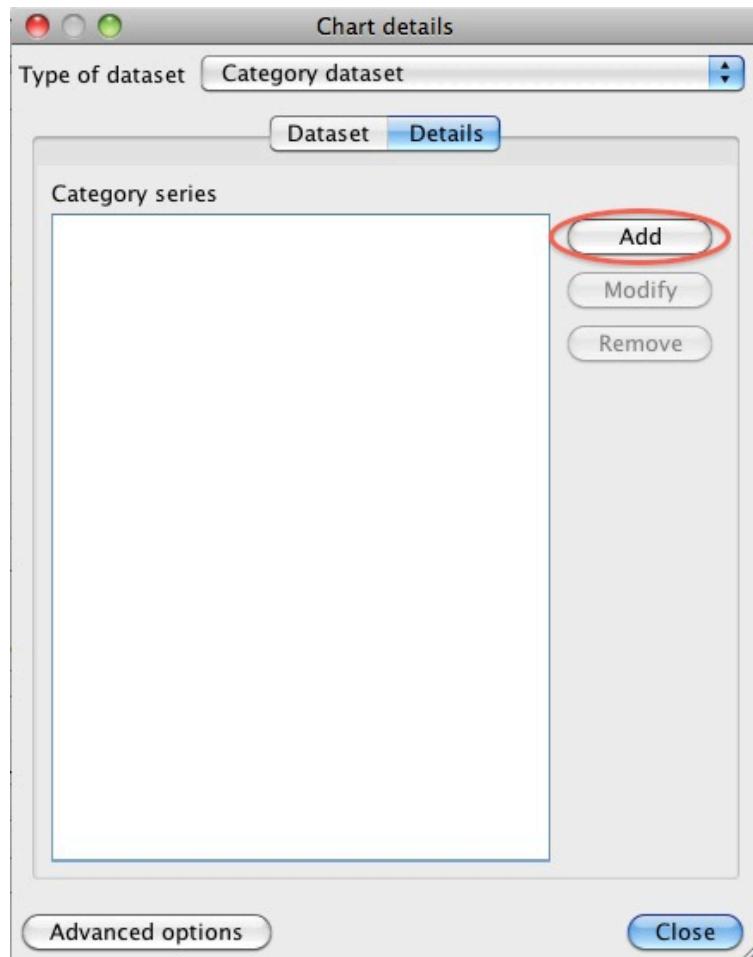

**`$F{organisation_unit_is_parent}.equals("Yes")`**

In our example, we only have one organisation unit, so this is not necessary. Next, click the details tab to see a list of the series in the chart. For now, this list is empty, but we will add one series for each of our three indicators. To add a series, click the Add button.

### Choose the Details tab

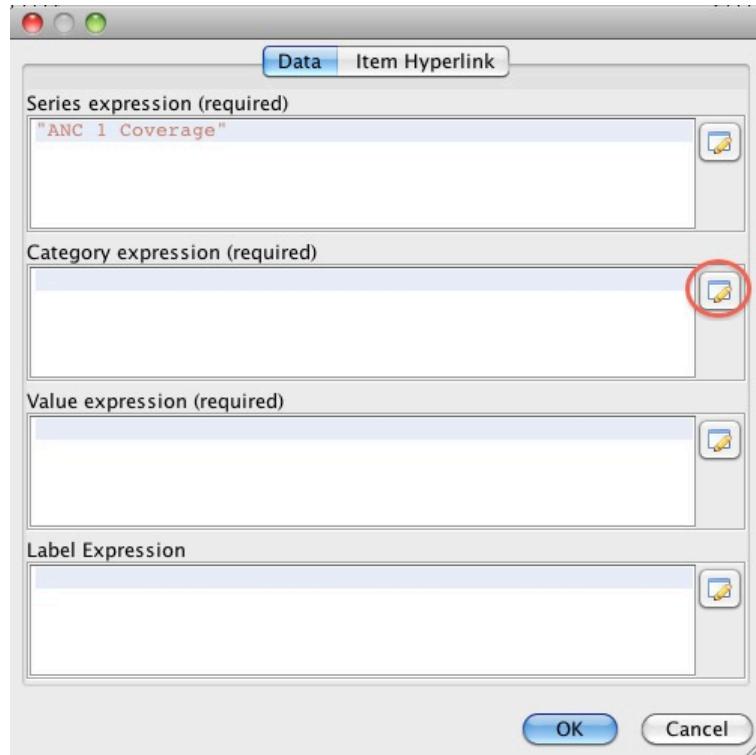

### Choose Add

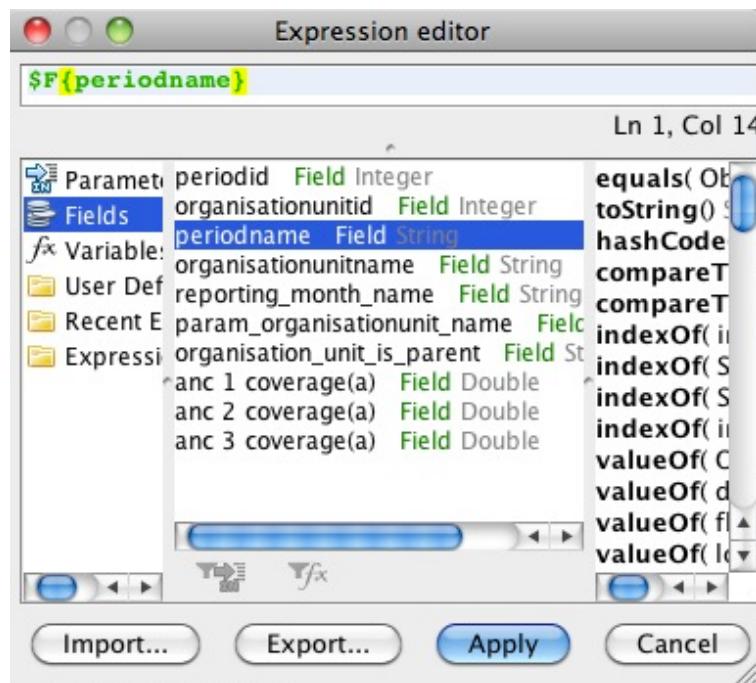

In the window that appears, enter the name of the first of the indicators in the Series expression window. Remember to put the name in quotes. In the category expression (along the x-axis) we want the months, so we use the button next to the field to open the Expression editor and add periodname.

## Edit the category expression

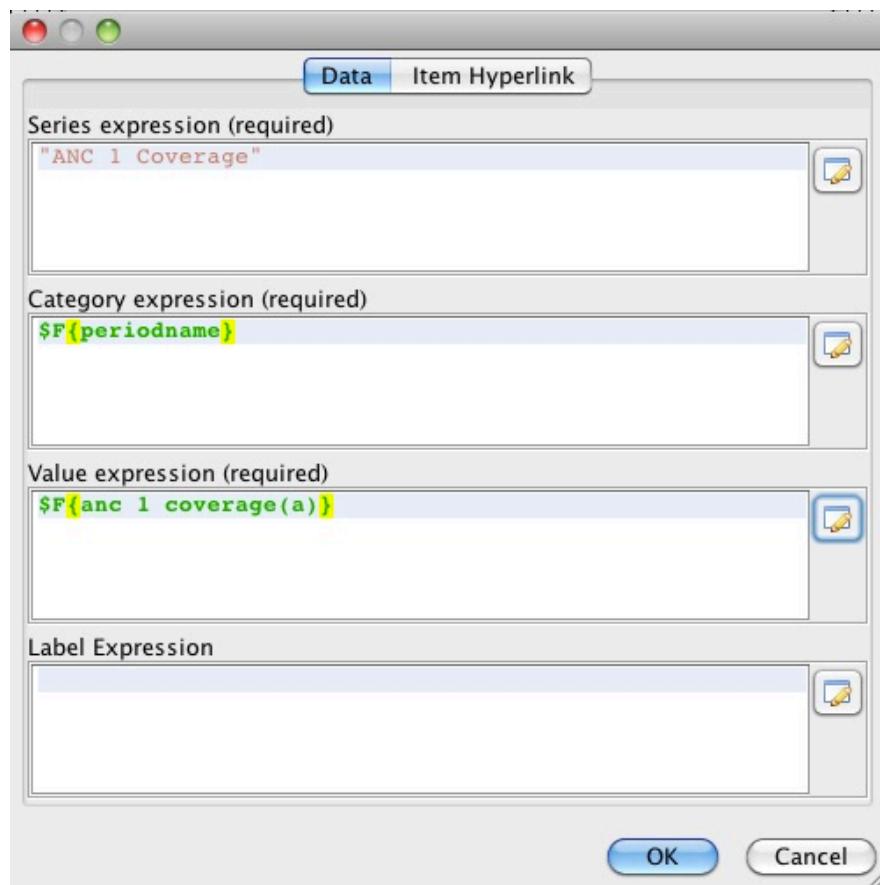

## Choose periodname as the expression

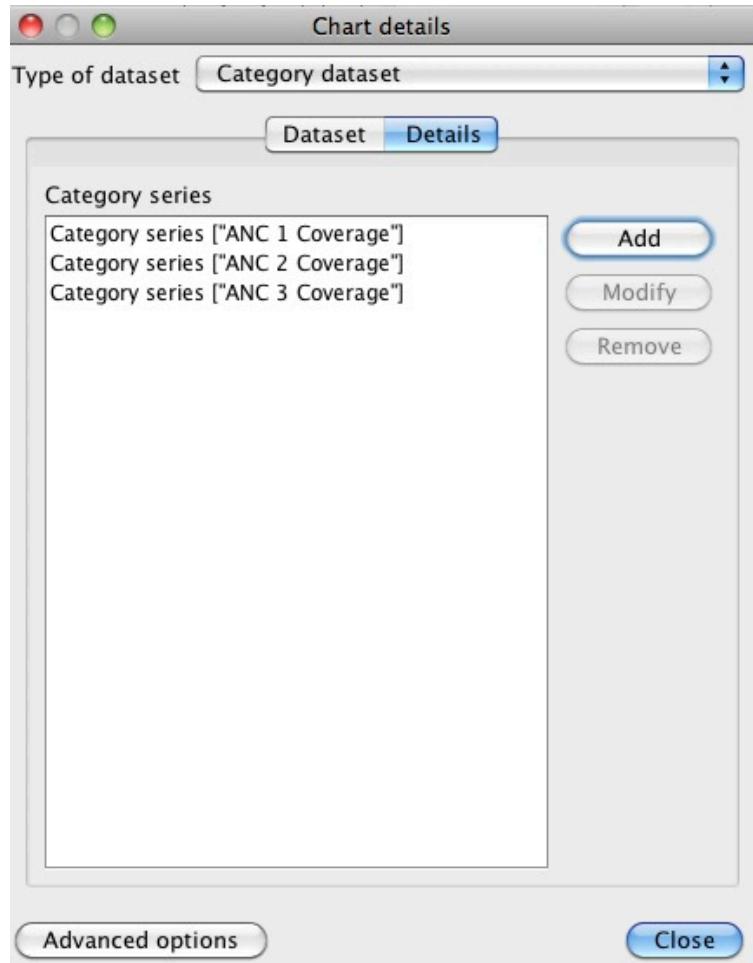

In the value expression, we add the actual data values for our first indicator. Use the Expression editor again to do this. When we are finished, the window should look like the one below, only with different names according to the indicator.

### The finished category series

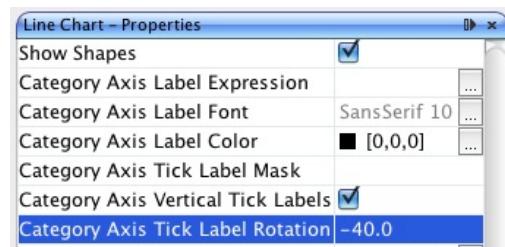

You can then Click OK to close the window. Follow the same steps to add a series for the other indicators.

## Chart details after adding three series

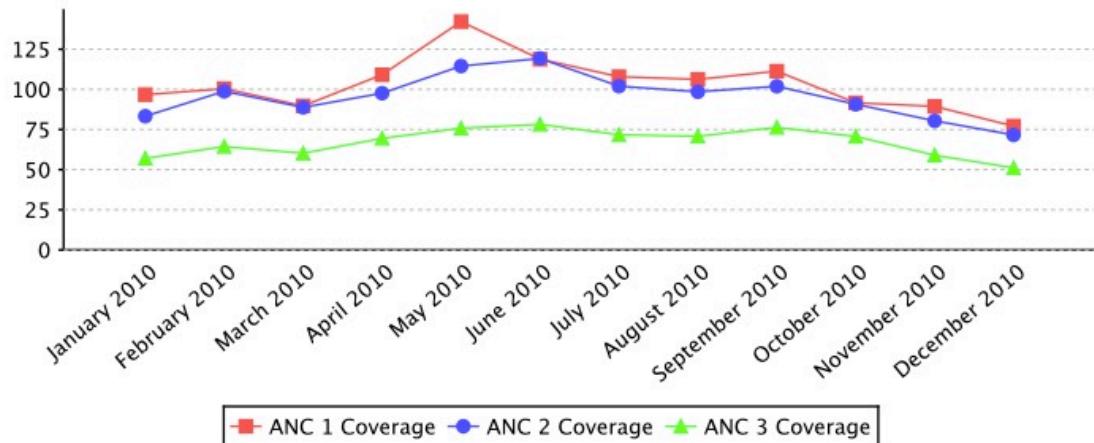

Close the window, and the data for the line chart should be ready. However, some additional adjustments might be needed - most of these can be found in the Line chart properties panel. For example, when making a month by month chart as we have in example, there is often not enough space for the month names along the category axis. This can be fixed by rotating the labels by for example -40 degrees, by using the property Category Axis Tick Label Rotation.

## Changing the appearance of the category labels

Many other options are available to give the chart the desired look.

## The finished line chart

### 25.4.2.10. Adding the Report to DHIS2

We can now switch to DHIS2 and import our report. Go to the Report Module in DHIS2, and select "Standard Report". In the "Standard Report" screen, click "Add new", or edit an existing one.

In the following screen, there are several actions we need to take. First, enter a name for the new "Standard Report". Second, for design, click "Choose File" and find the .jrxml-file you have edited in iReport. Then we select the report table that we used as a basis for the report in iReport. Click add, and it should move to the "Selected report tables" area. Finally, click save.

#### Upload the file and choose the right report table

Create new report

**Details**

Name  Design  Report.xml

**Available report tables**

- InPatients
- Outpatients
- Test-table

**Selected report tables**

If selecting no report table, the user is responsible for providing the data source table.

The report is now available as a "Standard Report" in DHIS2:

## The report is available as a Standard Report

### Standard Report

### 25.4.2.11. Some final guidelines

- Use the same version of iReport and DHIS2's version of Jasper reports. See the About page in DHIS2 for the Jasper version in use.
- Use report tables with cross tab dimensions as your data source for your report designs. This will make it a lot easier to design reports where you need to put specific indicators, periods, or orgunits on columns.
- Learn from others, there are many DHIS2 report designs for Jasper on launchpad, see <http://bazaar.launchpad.net/~DHIS2-devs-core/DHIS2/trunk/files/head:/resources/>

### 25.4.3. Designing SQL based standard reports

A standard report might be based on SQL queries. This is useful when you need to access multiple tables in the DHIS2 database and do custom selects and joins.

- This step is optional, but handy when you need to debug your reports and when you have direct access to the database you want to use. Click on the "report datasources" button, "New", "Database JDBC connection" and click "next". In this window you can give your connection a name and select the JDBC driver. PostgreSQL and MySQL should come included in your iReport. Then enter the JDBC connection URL, username and password. The last three refers to your database and can be retrieved from your DHIS2 configuration file (hibernate.properties). Click "save". You have now connected iReport to your database.

- Go to standard reports and click "add new", then "get report template". Open this template in iReport. This template contains a series of report parameters which can be used to create dynamic SQL statements. These parameters will be substituted based on the report parameters which we will later select and include in the standard report. The parameters are:

- periods - string of comma-separated identifiers of the relative periods
- period\_name - name of the reporting period
- organisationunits - identifier of the selected organisation units
- organisationunit\_name - name of the reporting organisation unit
- organisationunit\_level - level of the reporting organisation unit
- organisationunit\_level\_column - name of the corresponding column in the \_orgunitstructure resource table

These parameters can be included in SQL statements using the \${P!{periods}} syntax, where "periods" represents the parameter.

- To create a SQL query in iReport, click on the "report query" button. Write or paste your query into the textarea. An example SQL query using parameters which will create a report displaying raw data values at the fourth level in the org unit hierarchy is:

```
select district.name as district, chiefdom.name as chiefdom, ou.name as facility,
bcg.value as bcg, yellowfever.value as yellowfever, measles.value as measles
from organisationunit ou
left outer join _orgunitstructure ous
  on (ou.organisationunitid=ous.organisationunitid)
left outer join organisationunit district
```

```

    on (ous.idlevel2=district.organisationunitid)
left outer join organisationunit chiefdom
    on (ous.idlevel3=chiefdom.organisationunitid)
left outer join (
    select sourceid, sum(cast(value as double precision)) as value
    from datavalue
    where dataelementid=359706
    and periodid=$P!{periods}
    group by sourceid) as bcg on bcg.sourceid=ou.organisationunitid
left outer join (
    select sourceid, sum(cast(value as double precision)) as value
    from datavalue
    where dataelementid=35
    and periodid=$P!{periods}
    group by sourceid) as yellowfever on yellowfever.sourceid=ou.organisationunitid
where ous.level=4
and ous.$P!{organisationunit_level_column}=$P!{organisationunits}
order by district.name, chiefdom.name, ou.name;

```

Notice how all parameters are used in the query, along with SQL joins of resource tables in the DHIS2 database.

- Finally, back in the add new report screen, we click on "Use JDBC data source". This enables you to select any relative period and report parameters for your report. Relative periods are relative to today's date. Report parameters will cause a prompt during report creation and makes it possible to dynamically select organisation units and periods to use for your report during runtime. For the example above, we must select "reporting month" under relative periods and both "reporting month" and "organisation unit" under report parameters. Click save. This will redirect you to the list of reports, where you can click the green "create" icon next to your report to render it.

#### 25.4.4. Designing HTML based standard reports

A standard report can be designed using purely HTML and JavaScript. This requires a little bit of development experience in the mentioned subjects. The benefit of HTML based standard reports is that it allows for maximum flexibility. Using HTML you can design exactly the report you want, positioning tables, logos and values on the page according to your design needs. You can write and save your standard report design in a regular text file. To upload your HTML based standard report to DHIS2 do the following:

- Navigate to standard reports and click "Add new".
- Give the report a name.
- Select "HTML report" as type.
- If you want to you can download a report template by clicking on "Get HTML report template".
- Select desired relative periods - these will be available in JavaScript in your report.
- Select report parameters - these will be available in JavaScript in your report.

The report template, which you can download after selecting report type, is a useful starting point for developing HTML based standard reports. It gives you the basic structure and suggests how you can use JavaScript and CSS in the report. JavaScript and CSS can easily be included using standard script and style tags.

If you selected relative periods when creating the standard report you can access these in JavaScript like this:

```
var periods = dhis2.report.periods; // An array with period identifiers
var period = periods[0];
```

If you selected the organisation unit report parameter when creating the standard report you can access the selected organisation unit in JavaScript like this:

```
var orgUnit = dhis2.report.organisationUnit; // An object
var id = orgUnit.id;
var name = orgUnit.name;
var code = orgUnit.code;
```

When designing these reports you can utilize the analytics Web API resource in order to retrieve aggregated data in JavaScript. Have a look in the Web API chapter in this guide for a closer description. As a complete, minimal example you can retrieve analytics data after the report has been loaded and use that data to set the inner text of an HTML element like this:

```
<script type="text/javascript">
$( document ).ready( function() {
    $.get( ".../api/analytics?
dimension=dx:FnYCr2EAzWS;eTDtyyaSA7f&dimension=pe:THIS_YEAR&filter=ou:ImspTQPwCqd" ,
    function( json ) {
        $( "#bcg" ).html( json.rows[0][2] );
        $( "#fic" ).html( json.rows[1][2] );
    } );
} );
</script>

<div>BGG coverage: <span id="bcg"></span></div>
<div>FIC coverage: <span id="fic"></span></div>
```

A few other tips: To include graphics you can convert an image to SVG and embed that SVG content directly in the report - DHIS2 is based on HTML 5 where SVG tags are valid markup. To include charts and maps in your report you can use the charts and maps resources in the Web API. You can use the full capability of the Web API from JavaScript in your report - it may be useful to read through the Web API chapter to get an overview of all available resources.

# Chapter 26. Import and export data and metadata

In a primary health system, the HMIS typically involves a distributed application, where the same application is running in different geographical locations (PHCs, CHCs, hospitals, districts, and state). Most of these physical locations do not have Internet connectivity, and hence they work off-line. At some point (normally at the district level), the data needs to be synchronised in order to have a consolidated database for the a particular geographical region. For this, it is important to be able to export data from one location (which is working offline, say at the health facility level) to another one say at the district level where the data would need to be imported. This feature of exporting and importing is thus a crucial function of a HMIS. This feature also helps us overcome the dependency on Internet to some degree, as data updates can be transferred via USB key where there is no connectivity, or through email where there is limited Internet connectivity. DHIS2 provides robust export-import functionality to fulfill these needs.

To access the main Import-Export module, choose Services->Import-Export. A number of services are available, all of which will be described in detail in respective sections below.

Service	Description
Meta-Data Import	Import meta-data like data elements and organisation units using the standard DHIS 2 exchange format called DXF 2.
Data Import	Import data values on the DXF 2 XML, JSON, CSV and PDF formats. DXF 2 is the standard exchange format for DHIS 2.
Meta-Data Export	Export meta data like data elements and organisation units to the standard DHIS 2 exchange format.
Meta-Data Detailed Export	Export filtered meta-data like data elements and organisation units to the standard DHIS 2 exchange format.
Data Export	Export data values. This is the regular export function which exports data to the DHIS 2 exchange format called DXF 2.
Export to other systems	Export data and meta data to formats such as PDF, Excel and the DHIS 1.4 exchange format.

## 26.1. Meta-data import

### 26.1.1. Meta-data import

Meta-data objects can be easily imported by accessing Import-Export->Meta-Data import. Select the file to import by pressing "Select" and choose the file from your local file system. When importing XML and JSON files, the system will automatically detect which type of objects which should be imported. When importing CSV metadata, you will need to specify the object type. Consult the corresponding section in this manual on "CSV Metadata import" for more specific information on how the CSV file should be created.

## Default import screen

The screenshot shows the DHIS2 interface with a blue header bar. On the left, there's a sidebar with 'Import' and 'Export' sections. The main area is titled 'Meta-Data Import' and contains fields for 'File' (with a 'Choose File' button and 'No file chosen' message), 'Format' (set to 'XML'), 'Dry run' (set to 'No'), and 'Strategy' (set to 'New and Updates'). A large green 'Import' button is at the bottom.

There are two separate options for importing data.

- Dry run: This is similar to the old preview option, this will do a dry run import, and give you information about any errors.
- Strategy: There are three options here, "New and Updates", "New only", and "Update only". New and updates tells the importer to expect both new meta-data, and updates to existing ones. New only will only accept fresh meta-data, usually you would use this on an empty database. Updates only will only allow the meta-data to match meta-data that is already there (same identifiers, new name etc).

### Note

**It is highly recommend always using the Dry run option** when importing data to make sure you keep control over any changes to your meta-data and databases being out of sync on data elements or organisation unit names

#### 26.1.1.1. Dry run before importing

Before doing the import into your database, it is highly recommended that you run the import with the dry run option set to true first. This will enable you to have a look at how many new, updates, and ignored meta-data there will be. After you have selected your file, set dry run to true, you can now click the import button. After doing this, you will be greeted by this window.

The screenshot shows the 'Meta-Data Import' window with the same configuration as the previous one. Below the form, a yellow box displays the import summary:

```

Display import summary
2014-12-28 16:15:26 Import done. Completed in 14.35 seconds. ✓
2014-12-28 16:15:25 Importing 380 OrganisationUnits
2014-12-28 16:15:11 Importing meta-data
  
```

Here you can see a short summary of what was contained in your import file. To see further details, please click on the "Display import summary" link.

The screenshot shows the DHIS2 interface with the title "DHIS 2 Demo - Sierra Leone". The left sidebar has sections for Import, Export, Configuration, and Integration. The main area is titled "Meta-Data Import" and contains fields for "File" (Choose File, No file chosen), "Dry run" (No), and "Strategy" (New and Updates). A large green box displays the "Import summary" with counts: 1 Imported, 1336 Updated, 0 Ignored. Below this is a "Type Summary" table:

Type	Imported	Updated	Ignored
OrganisationUnit	1	1332	0
OrganisationUnitLevel	0	4	0

Here you can see that the import dry run was successful and the import contained **1** new organisation unit, **1332** updated, and **4** organisation unit levels.

Below you can see another example.

The screenshot shows the DHIS2 interface with the title "DHIS 2 Demo - Sierra Leone". The left sidebar has sections for Import, Export, Configuration, and Integration. The main area is titled "Meta-Data Import" and contains fields for "File" (Choose File, metaData.xml.zip), "Dry run" (No), and "Strategy" (New and Updates). A large green box displays the "Import summary" with counts: 1 Imported, 1336 Updated, 0 Ignored. Below this is a "Type Summary" table:

Type	Imported	Updated	Ignored
OrganisationUnit	1	1332	0
OrganisationUnitLevel	0	4	0

Below the summary is a "Conflicts" section with a table:

Type	Element	Description
OrganisationUnit	Nduvuibu MCHP	Unknown reference to IdentifiableObject(id=0, uid='aaaU6Kr7Gtpidn', code='null', name='null', created=null, lastUpdated=null) (OrganisationUnit) on object IdentifiableObject(id=0, uid='aByTU5Wgds', code='OU_8388', name='Nduvuibu MCHP', created=Fri Feb 17 09:54:39 CET 2012, lastUpdated=Thu Mar 19 09:12:00 CET 2013) (OrganisationUnit).

Here you can see that the organisation unit "Nduvuibu MCHP" had a unknown reference to an object with ID "aaaU6Kr7Gtpidn", which means that an object with this ID was not present in your imported file, and it could not be found in the existing database. Its important to note that

even if a reference could not be found, the object will still be imported, but you might have to fix this directly in DHIS2 later, if the reference should have pointed to something else.

### 26.1.1.2. Matching identifiers in DXF2

The DXF2 format currently support matching for two identifiers, the internal DHIS2 identifier (known as a UID), and also using an external identifier called a "code". When the importer is trying to search for references (like the one above), it will first go to the UID field, and then to the code field. This allows you to import from legacy systems without having a UID for every meta-data object. I.e. if you are importing facility data from a legacy system, you can leave out the ID field completely (DHIS2 will fill this in for you) and put the legacy systems own identifiers in the code field, this identifier is required to be unique. This not only works for organisation units, but for all kinds of meta-data, allowing for easy import from other systems.

### 26.1.2. Import CSV meta-data

To import CV meta-data go to import-export module and select CSV Meta-Data Import form the left side menu. You must select the object type which your CSV file contains. You can only upload one type of objects at the time. Upload your file and click update. For the CSV format, please visit the Web API chapter > CSV meta-data import in the developer guide.

### 26.1.3. GML data import

The GML import function can be used to import data prepared in the Geography Markup Language (GML). GML can be used to update the coordinates (both polygons and points). Once you have prepared your GML file as detailed in the chapter on "Importing coordinates", you can load the file with this function.

Importing the organisation unit hierarchy from GML is not supported. Therefore you should create the organisation unit hierarchy separately, and then use GML to update the coordinates once the hierarchy has been created.

## 26.2. Import data

The import option allows different instance of DHIS2 to receive standardised sets of data in the absence of a networked system. The functionality can also be used to import data produced by another system (perhaps on a regular basis) or to import legacy data which has been transformed into a format which DHIS2 can understand. Typically, a data set is exported from one DHIS2 instance (e.g. a district level system) to another system (e.g. a provincial level system). DHIS2 is also capable of importing data directly from a DHIS2 1.4 Access database. Each of these options will be discussed in the following sections.

### 26.2.1. XML data import

To import data in XML format, simply select Services->Import-export->XML data import. Similar options to the XML meta-data import facility are available. Please refer to the Developer guide > Web API > Data values chapter on XML data import for details on the XML format which is used by DHIS2 for aggregate data import.

### 26.2.2. Import CSV data

DHIS2 supports import of data in the CSV (Comma Separated Values) format. This can be used to import exchange file produced by DHIS2 itself. It also comes in handy when you want to import data from a third-party system as CSV is widely supported in applications and is easy to produce manually.

To import a CSV data exchange file navigate to the *CSV Data Import* item in the left-side menu. Upload the exchange file and click *Import*. CSV files can be imported both as plain text file or as compressed ZIP file archive.

Please refer to the Developer guide > Web API > Data values chapter on CSV data import for a description of the CSV format to use.

### 26.2.3. Event data import

Event data can also be easily imported with the "Event data import" function. Refer to the section in the WebAPI for more information on the format used for importing events. Otherwise, the functionality is the same as the XML data import used for aggregate data.

### 26.2.4. Import PDF data

DHIS2 supports import of data in the PDF format. This can be used to import data produced by off-line PDF data entry forms. Please refer to the section "Data set management" for details on how to produce a PDF form which can be used for off-line data entry.

To import a PDF data file, navigate to the *PDF Data Import* item in the left-side menu. Upload the completed PDF file and click *Import*.

After the import process is finished, you can follow the link to the import summary, which will inform you about the outcome of the import process in terms of number of records imported, updated and ignored and potential conflicts.

### 26.2.5. Import data from DHIS2 1.4

There are two ways to import data from a DHIS2 1.4 database; 1) through the 1.4 XML-based export files, or 2) directly from the DHIS2 1.4 data file (.mdb). Both are accessible from the DHIS2 1.4 Import menu under Import in the Import-Export module.

It is critical that all data integrity violations which are present in the DHIS2 1.4 database be fully resolved before attempting an import into DHIS2. You can check the data integrity of DHIS2 1.4 through the CORE Module->Advanced->Data integrity checks. A report will be generated of all data integrity violations which should be resolved prior to importing into DHIS2.

#### Warning

When data is imported from DHIS2 1.4, both the meta-data as well as data are imported. You should therefore be exceedingly careful that the meta-data present in DHIS2 1.4 is compatible with your DHIS2 data, otherwise during a DHIS2 1.4 data import, the meta-data in the DHIS2 system will be potentially overwritten by the i

#### 26.2.5.1. DHIS2 1.4 File (database) Import

This method is recommend when doing large imports from 1.4, and especially when importing into a new DHIS2 database.

##### DHIS2 1.4 File Configuration

Before you can start the 1.4 file import you need to provide a few details about the 1.4 database:

*Datafile(#):* Here you put the full path to the DHIS2 1.4 data file you want to import from, e.g. C:\DHIS14\DHIS\_#LR\_LIBERIA.mdb.

*Username:* Leave blank (unless you have set up extra security measures on the file)

*Password:* Leave blank (unless you have set up extra security measures on the file)

*Levels:* Provide the number of levels in the orgunit hierarchy in your 1.4 database, e.g. 5.

Click "Save" and you will return to the DHIS2 1.4 File Import window.

### **Import Type:**

As with other imports you have the options to Import (directly), Preview, or Analyse the import. We recommend using the Analyse option first to check that the 1.4 database is OK and ready to be imported.

When importing a large database into a new blank DHIS2 database we recommend using the Import option to save time.

For smaller incremental imports the Preview is OK.

### **Last Updated:**

If you want the full import, all the data in the 1.4 database you leave this field blank.

If you only want to do an incremental import into an already existing DHIS2 database you can use this field to filter which data values to import. Only values added or edited after the date you specify will be imported. This filter makes use of the LastUpdated column in the RoutineData table in the DHIS2 1.4 data file.

### **Import process:**

When you are done selecting Method, and LastUpdated you can begin the import by clicking on the Import button. This process might take a long time, depending on how many data values you are importing. On a reasonable spec. computer the import takes about 2 million records per 30 minutes.

## **26.2.5.2. DHIS2 1.4 XML Import**

Import though XML data from DHIS2 1.4 is also possible using the standard DHIS2 1.4 export format. Just be sure that the DHIS2 1.4 export format has been set to "DHIS 2" as illustrated in the screen shot below. After the data has been exported by DHIS2 1.4, you can import the data by choosing "Services->Import-Export->DHIS 1.4 Import->DHIS2 1.4 XML Import" and proceeding via the procedure outline in the [previous section](#).

The screenshot shows the 'Enter Export criteria' dialog box. In the 'Export File Format' section, there are three radio buttons: 'DHIS 1.4', 'DHIS 1.3', and 'DHIS 2'. The 'DHIS 2' radio button is circled in red.

### 26.2.5.3. Limitations to DHIS2 1.4 imports

Although it is possible to import and export data between instances of DHIS2 1.4 and DHIS2, there are significant limitations. Currently, the import of some metadata is not supported from DHIS2 1.4 to DHIS2. This includes:

- Organisational unit alternate names
- Compulsory data element pairings
- Custom data entry forms
- Dataset data entry levels

It is also important that the aggregation operator defined in DHIS2 1.4 be set to the correct value. Some data, such as population, should have their aggregation operator set to "Average" in DHIS2, as this controls how the aggregation of data is handled over time (but not within the organisational unit hierarchy).

## 26.3. Export data and meta-data

DHIS2 makes it possible to export various types of data in multiple data formats. You can export your data, also referred to as measures or facts; and your meta-data, which refers to the information describing your data. Data can be exported both in raw, non-aggregated format and in aggregated format. It is also possible to export a combination of data and meta-data in case you have special requirements. This chapter covers mainly how to export data and meta-data through the user interface of the import-export DHIS2 module. Data can also be exported programmatically through the DHIS2 Web API, and it is useful to be aware of the various options available:

- Export raw, non-aggregated data through the user interface: Covered in this chapter.
- Export aggregated data programmatically through the Web API: Please refer to the Web API chapter, section on Analytics.
- Export a combination of data and meta-data: Please refer to the SQL view sections in the Data administration chapter and Web API chapter.
- Export meta-data through the user interface: Covered in this chapter.
- Export meta-data programmatically through the Web API: Please refer to the Web API chapter, section on meta data.

Data can be exported on various formats, including DXF 2 (the DHIS2 meta-data and data exchange format based on XML), CSV, PDF, MS Excel and the DHIS2 1.4 XML format.

Another aspect of data export is the type of DHIS2 deployment. In the case of online deployment, all data is saved into a single database only. In an offline deployment, each instance will store data in a separate database in their local system. In an offline deployment, after the data entry is finished, data will have to be manually sent to the next level in the organizational hierarchy. In an on-line application this is not required, as all data is captured over an Internet connection and stored in a central location.

### 26.3.1. Metadata export

Meta-data is "data about data". In the context of DHIS2, meta-data consists of definitions of data elements, indicators, the structure and names contained in the organizational hierarchy, and other options. Click on the "Meta-data export" link from the main "Data export" screen in order to access this. Just select the features, format, and the compression that you want and click "Export". This metadata file can then be transmitted just like a data file, except it will contain information on the definitions of the various features, as opposed to the values of the data themselves.

The screenshot shows the DHIS2 interface for 'Meta-Data Export'. On the left, there's a sidebar with 'Import' and 'Export' sections. Under 'Import', 'Meta-Data Import' and 'Data Import' are listed. Under 'Export', 'Meta-Data Export', 'Meta-Data Detailed Export', 'Data Export', and 'Export to other systems' are listed. The main area is titled 'Meta-Data Export' and contains a large list of objects with checkboxes. Most checkboxes are checked. The objects include: Attribute, Category, Category Combo, Category Option, Category Option Group, Category Option Group Set, Chart, Constant, Dashboard, Data Approval Level, Data Element, Data Element Group, Data Element Group Set, Data Set, Document, Event Chart, Dashboard Item, Indicator, Indicator Group, Indicator Group Set, Indicator Type, Map, Map Layer, Map Legend, Map View, Option, Option Set, Organisation Unit, Organisation Unit Group, Organisation Unit Group Set, Organisation Unit Level, Program, Program Stage, Program Validation, Relationship Type, Report, Report Table, Section, Sql View, Tracked Entity, Tracked Entity Attribute, User, User Group, User Credentials, User Role, Validation Criteria, Validation Rule, and Validation Rule Group. Below this list are buttons for 'Select all' and 'Select none', and dropdown menus for 'XML' and 'Zipped'. At the bottom is a large 'Export' button.

Simply choose the objects which you would like to export, and click "Export".

### 26.3.2. Metadata export with dependencies

Metadata export with dependencies lets you create canned exports for metadata objects. This type of export will include the metadata objects and the metadata object's related objects, that is the metadata which belong together with the main object.

**Table 26.1. Object types and their dependencies**

Object type	Dependencies included in export
<b>Data set</b>	Data elements Sections Indicators Indicator types Attributes Data entry forms Legend sets Legends Category combinations

<b>Object type</b>	<b>Dependencies included in export</b>
	Categories Category options Category option combinations Option sets
Program	Data entry form Tracked entity Program stages Program attributes Program indicators Program rules Program rule actions Program rule variables Program attributes Data elements Category combinations Categories Category options Category option combinations Option sets
Category combination	Category combinations Categories Category options Category option combinations Attributes
Dashboard	Dashboard items Charts Event charts Pivot tables Event reports Maps Reports Resources

<b>Object type</b>	<b>Dependencies included in export</b>
Data element group	Data elements Category combinations Categories Category options Category option combinations Option sets Attributes Legend sets Legends

1. Open the **Import-Export** app.
2. Click **Metadata dependency export**.
3. Select an **Object type: Data set, Program, category combo, Dashboard or Data element group**.
4. Select an **Object**.
5. Select a **Format**.
6. Select a format: **XML or JSON**.
7. Select **Compression: Zip, Gzip or Uncompressed**.
8. Click **Export**. The export file is downloaded to your local computer.

### 26.3.3. Data export

To export raw data from DHIS2, choose "Import-export->Data export". Select the organisation unit(s), the start and end date, and dataset or data sets for which data export should be selected. You can also select which types of identifiers which will be exported by pressing "More options" and then selecting either UID, Code, or Name for data elements, organisation units and category options. Once you have specified all options as required, press "Export as..." along with the format which you would like to export the data as (XML, JSON or CSV).

Category ID scheme: UID

Export as XML      Export as JSON      Export as CSV

A pop-up save option will appear on the displayed screen (see picture below) prompting the saving of the exported data. You may save the export folder on your desktop or any other folder by selecting the 'Save to Disk' option from the pop-up prompt.

#### 26.3.4. Event data export

You can export event or tracker data in **XML**, **JSON** or **CSV** formats.

1. Open the **Import-Export** app.
2. Click **Event Export**.
3. Select an organisation unit.
4. Select a program and a program stage (if applicable).
5. Select the **ID scheme** to use for export: **UID** (default) or **CODE**.

If you select **CODE** but the object's attribute does not have code, it will not be included in the return payload.

6. Select **Start date** and **End date**.
7. Select the **Inclusion**:
  - **Selected organisation unit**: Export event data only for the selected organisation unit
  - **Include children of organisation unit**: Export event data for the children of the organisation unit as well as the selected organisation unit itself.

- **Include descendants of organisation unit:** Export event data for the descendants of the organisation unit as well as the selected organisation unit itself.

8. Select a format: **XML, JSON or CSV**.

9. Select **Compression: Zip, Gzip or Uncompressed**.

10 Click **Export**. The export file is downloaded to your local computer.

## 26.3.5. Export data to other systems

### 26.3.5.1. DHIS2 1.4 Meta-data export

The DHIS2 1.4 Meta-data export functionality provides the same functionality as the standard DHIS2 meta-data export, except that the resulting file can be used to transmit meta-data information to DHIS2 1.4 systems.

#### DHIS 1.4 XML Meta-Data Export

**26.3.5.4. XLS metadata export**

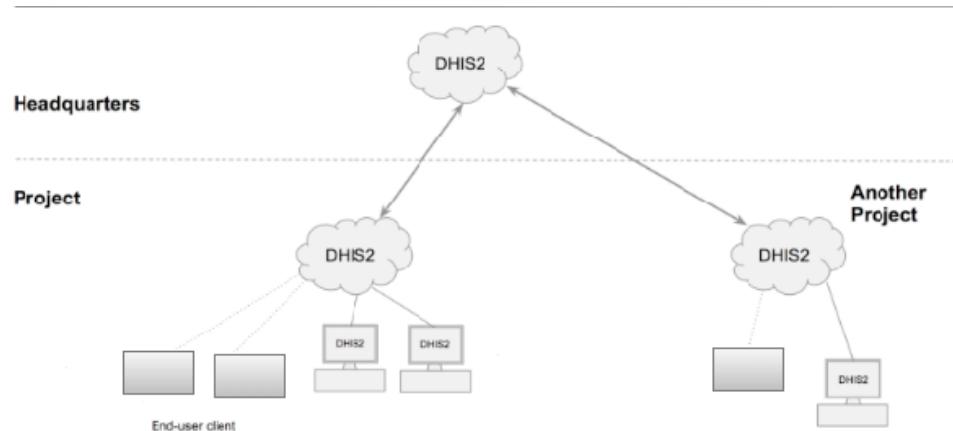

Meta-data can be exported directly to the XLS format with this function. Simply click all of the available object which you wish to export and click "Export".

# Chapter 27. Configure metadata synchronizing

## 27.1. About data and metadata synchronization

You can synchronize data and metadata between different DHIS2 instances. Given two instances in a central-local deployment strategy, metadata created at the central system can be synchronized with the local system and the data created at local system can be synchronized with the central system. This can be useful when you've multiple stand-alone instances of DHIS2 and global metadata needs to be created at all the local instances.

If metadata creation and update take place at the central system and if the metadata synchronization task is enabled, the metadata gets synchronized down to all the local instances which are bound to the central instance. These local instances will in turn push data values to the central instance. Enabling or disabling versioning of metadata synchronization at local instance, will not hinder the metadata synchronization process. This is because the metadata synchronization interacts with versioning end points of the central instance and not with end points of the local instance.

Each snapshot of metadata export generated is referred to a metadata version. A new metadata version contains only the changes between the previous version and the current version, that is it's an export between two timestamps. All metadata versions are maintained in the DHIS2 database and are available to all local instances that connect to it. You can schedule each of the local instances to download new metadata versions. It is recommended to keep the metadata versions' sizes small and logical.

### ! Don't create new metadata versions on local instances

Each instance of DHIS2, whether central or local, can create metadata versions. The local instance is meant to synchronize metadata from a central system and not create metadata on its own.

If a new metadata version is created on the local instance, this instance can't receive new metadata versions from the central instance, since the content of the metadata versions will be out of synchronization.

If you've created metadata versions on a local instance, you must manually deleted these versions from the database before you can synchronize with the central instance.

### Example 27.1.

Assume the central and local DHIS2 instances have identical metadata snapshots until version 10. Then the local instance creates a new snapshot called version 11. After that, the central instance creates a new snapshot called version 11. When the local instance attempts to synchronize metadata, version 11 is not downloaded. However, the content of version 11 on the local instance is not identical to the content of version 11 on the central instance.

### Note

You can also use the **Import-Export** app to synchronize metadata manually.

## 27.2. Workflow

1. On the central instance, configure metadata versioning. You should do this once the central instance contains metadata.
2. Connect local instance(s) to the central instance.
3. On local instance(s), configure automatic synchronization.

## 27.3. Configure metadata versioning on central instance

### Note

To synchronize metadata, the user account of the central system must have the following authority:

#### **F\_METADATA\_MANAGE**

Only users with this authority will then be able to create and download metadata. This is to ensure security of the central system where the metadata is created. Instead of giving the credentials of user having ALL authority to the field instances, you need to create a user having this specific authority only.

1. On the central instance, open the **System Settings** app and click **Synchronization**.
2. Go to the **Metadata versioning** section and select **Enable versioning for metadata sync**.

3. (Optional) Select **Don't sync metadata if DHIS versions differ**.
4. Select a type of metadata version: **Best effort** or **Atomic**.
  - *Best effort* means that if the metadata import encounters missing references (for example missing data elements on a data element group import) it ignores the errors and continues the import.
  - *Atomic* means all or nothing - the metadata import will fail if any of the references do not exist.

## Note

Each metadata entity is associated with a "User" object. If this "User" reference is missing while importing metadata version of type ATOMIC, the import will fail at the validation phase itself. This means that the user who creates metadata also needs to synchronize down to local instances to successfully import the metadata version of type ATOMIC.

5. Click **Create new version**. The new version is added to the versioning table.

## 27.4. Connect local instance to central instance

To enable metadata synchronization, you must configure the connection between the local instance and the central instance.

1. On the local instance, open the **System Settings** app and click **Synchronization**.
2. Add the central DHIS2 instance's details to the local instance:
  - **Remote server URL**
  - **Remote server user name**
  - **Remote server password**
3. Go to the **Metadata versioning** section and select **Enable versioning for metadata sync**.
4. (Optional) Select **Don't sync metadata if DHIS versions differ**.

The metadata schema changes between versions of DHIS2 which could make different metadata versions incompatible.

When enabled, this option will not allow metadata synchronization to occur if the central and local instance(s) have different DHIS2 versions. This apply to metadata synchronization done both via the user interface and the API.

The only time it might be valuable to disable this option is when synchronizing basic entities, for example data elements, that have not changed across DHIS2 versions.

5. (Optional) Configure email notifications to notify users about successful or unsuccessful metadata synchronization:
  - a. Open the **System Settings** app and click **Email**.
  - b. Enter **Host name**, **Port**, **User name**, **Password** and **Email sender**.
  - c. Click **Server** and enter a **System notifications email address**.

This email address will receive notifications about the metadata synchronization status.

## Tip

When you receive email notification about a metadata synchronization failure, check which metadata version that causes the error and resolve it. Then you avoid future errors when the system downloads new metadata versions.

## 27.5. Configure automatic metadata synchronization on local instance

Once you have configured automatic metadata synchronization (scheduling) on local instance(s), the scheduler will run at that specific time and synchronize (download and import) the metadata from the central instance. No manual intervention is required from the users at the local instance(s).

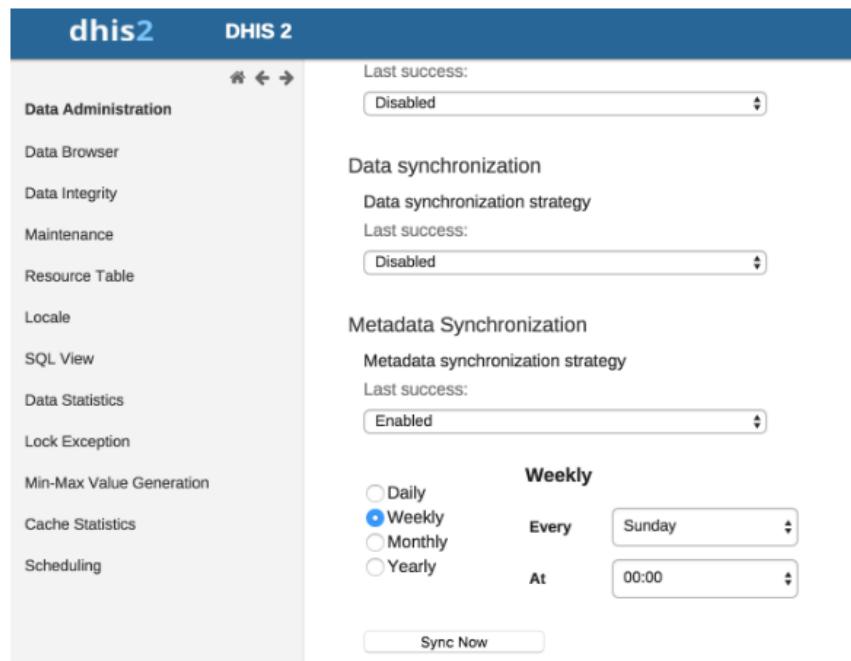

After the scheduler has completed the metadata synchronization, the local instance will have the metadata exactly as created on the central system.

## Note

Passwords of users are not synchronized. They are nullified for security reasons. After metadata synchronization, the Admin user must reset these passwords.

1. On the local instance, open the **Data Administration** app and click **Scheduling**.
2. In the **Metadata Synchronization** section, select **Enabled**.
3. Select a time period: **Daily**, **Weekly**, **Monthly** or **Yearly**.

4. Click **Start**.

## 27.6. Create a new metadata version manually on central or local instance

1. Open the **System Settings** app and click **Synchronization**.
2. Go to the **Metadata versioning** section and select **Enable versioning for metadata sync**.
3. (Optional) Select **Don't sync metadata if DHIS versions differ**.
4. Select **Best effort** or **Atomic**.
5. Click **Create new version**. The new version is added to the versioning table.

### Example 27.2. Versioning table for a central instance

When the system is a *central instance*, you'll see three columns in the versioning table:

**Synchronization settings**

General

Server

Appearance

Email

Messaging

Access

Approval

Calendar

Data Import

**Synchronization**

OAuth2 Clients

Remote server URL

Remote server username

Remote server password

**Metadata Versioning**

Enable Versioning for metadata sync

**Create new version**

Best Effort     Atomic    **CREATE NEW VERSION**

**Master Version: Version\_29**

Version	When	Type
Version_29	6/23/2016, 4:02:25 PM	BEST EFFORT
Version_28	6/23/2016, 3:59:53 PM	BEST EFFORT
Version_27	6/21/2016, 6:21:46 PM	BEST EFFORT
Version_26	6/21/2016, 5:59:30 PM	BEST EFFORT
Version_25	6/21/2016, 4:51:08 PM	BEST EFFORT

Object	Description
Master version	The latest version in the system.
Version	Name of the version. The name is automatically generated by system.
When	The timestamp of the metadata version creation at the central instance.
Type	Type of metadata version.

### Example 27.3. Versioning table for a local instance

When system is a *local instance*, you'll see four columns in the versioning table:

Search settings

General

Server

Appearance

Email

Messaging

Access

Approval

Calendar

Data Import

**Synchronization**

OAuth2 Clients

Remote server URL: <https://msfocamdsynchq.twhosted.com>

Remote server username: admin

Remote server password:

**Metadata Versioning**

Enable Versioning for metadata sync

**Create new version**

Best Effort     Atomic    **CREATE NEW VERSION**

Master Version: Version_35		Last sync attempt: Version_30   Failed   6/23/2016, 4:05:25 PM	
Version	When	Type	Last Sync
Version_29	6/23/2016, 4:02:25 PM	BEST EFFORT	6/30/2016, 10:22:15 AM
Version_28	6/23/2016, 3:59:53 PM	BEST EFFORT	6/30/2016, 10:22:15 AM
Version_27	6/21/2016, 6:21:46 PM	BEST EFFORT	6/30/2016, 10:22:12 AM
Version_26	6/21/2016, 5:59:30 PM	BEST EFFORT	6/30/2016, 10:22:07 AM
Version_25	6/21/2016, 4:51:08 PM	BEST EFFORT	6/30/2016, 10:22:05 AM

Object	Description
Master version	The latest version of the central instance.  <b>Note</b> The master version information is the central instance's latest version. This is important to look at the difference between the versions of metadata that exist at central and at local.
Last sync attempt	If the last sync attempt is a failure, this will be displayed.
Version	Name of the version. The name is automatically generated by system.
When	The timestamp of the metadata version creation at the central instance.
Type	Type of metadata version.
Last sync	Timestamp of when the last sync happened for this version in this system.

## 27.7. Reference information: metadata synchronization configuration parameters

The process which performs metadata synchronization is called Metadata Sync Task. This task performs a series of steps before syncing of metadata:

- Push data (aggregate data and anonymous events data) from local instance to central instance.
- Gets the current metadata version of the local instance. Then uses this version information as a baseline to fetch the list of metadata versions created after the baseline.

- If there are new versions created at central instance, it performs the synchronization of metadata versions one after the other. A mail will be sent to the configured user (if any) after each successful synchronization of metadata version at the local instance.

Once the Metadata Sync Task has run at the scheduled time, the task can retry (if any of the steps fail) based on the configuration of the following parameters defined in `dhis.conf` file:

Parameter	Default value
<code>metadata.sync.retry</code>	3
<code>metadata.sync.retry.time.frequency.millisec</code>	30000

Each retry will be made after the time (in millisecond) as specified. If the steps still fail even after all the retries, then the scheduler stops its execution and then a mail will be sent to the configured user (if any). If no values are specified then the default values will be used.

#### **Example 27.4. Metadata synchronization configuration parameters**

```
metadata.sync.retry = 5
```

```
metadata.sync.retry.time.frequency.millisec = 10000
```

# Chapter 28. Mobile

This chapter covers various mobile technologies including Web, J2ME, SMS Service and SMS Command.

## 28.1. DHIS2 Mobile Introduction

DHIS2 provides a range of options to allow data entry from mobile devices, including a dedicated GPRS/3G J2ME client and two versions of DHIS2 which have been optimized specifically for mobile browsers. Each of these solutions will be described in detail in the following sections. DHIS2 offers several Android clients, which are described in detail in other sections of this guid.

Collection of data in the field can be technically challenging and expensive. Mobile phone solutions have the potential to significantly reduce the complexity of deploying a distributed data collection system. Using a simple Java client installed on a mobile phone or a web browser which works on the mobile phone, field workers can report directly to the DHIS2 database through their mobile device.

While mobile phone solutions have a great potential, there are complexities with such deployments. Phones lack processing power and have a small display, they need to be charged, and often such deployments make the most sense in areas with poor or intermittent network coverage.

Each of the mobile solutions are introduced briefly below, and the discussed in separate sections in detail:

- DHIS2 Light: A mobile browser optimized data entry module for all devices

This module allows for data entry directly with the browser of the mobile device. A wide range of devices and mobile browsers are supported including: Opera mini 3 & 4 (basic and advanced) - Opera mini 4, Nokia S40 mobiles ,Windows Phone 7, Window Mobile 6, Palm Pre, Blackberry (v5 and v6), Firefox mobile, iOS devices (iPhone) and Android devices. This client does not have offline-support, and an active GPRS/3G connection is required. It does not require a new application installation on the phone to support new features, but does require a stable data connection for use. This solution is described in [Section 28.2, “Mobile browser based data entry”](#)

- DHIS2 Smartphone client: A mobile browser optimized data entry module for Smartphone devices

This module allows for data entry directly with the browser of a Smartphone. Offline data entry is supported and it does not require any installation of a special client on the phone itself.

- J2ME GPRS/3G client

DHIS-mobile includes two separate J2ME clients supporting GPRS/EDGE/3G as a transport mechanism. One clients supports facility aggregate reporting and the second client supports name-based program tracking. These clients are split into separate applications to make deployment easier. Some health workers may have both applications installed on their phone. Both of these clients support offline-storage of data and work on J2ME enabled devices (feature phones).

An active GPRS/3G connection is required in order to send data to the DHIS2 database, but data can be entered offline and transmitted when a connection is present. This client is intended primarily for low-end devices which support J2ME applications, although the offline-

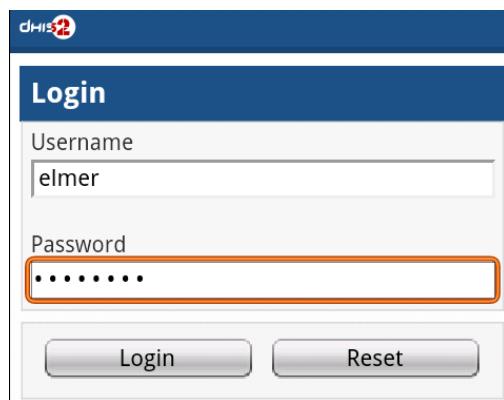

supports adds some memory requirements which limits the handset selection. While the solution is primarily tested on Nokia phones, it also works on several other J2ME capable handsets.

The facility reporting J2ME client is described in the chapter "J2ME GPRS/3G Client"

## 28.2. Mobile browser based data entry

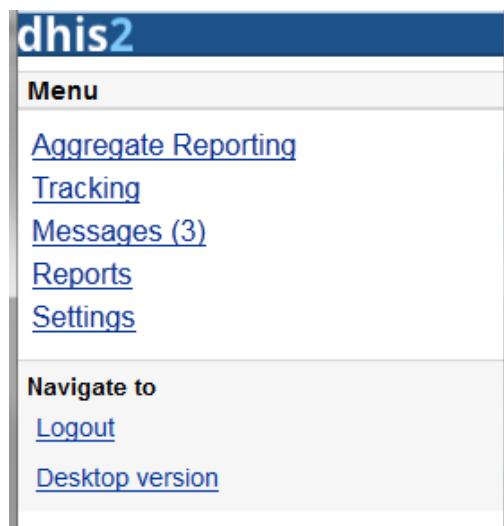

### 28.2.1. Getting started with mobile browser data entry

This approach is for data-entry on a smart phone with a mobile browser by navigating to the URL of the DHIS2 instance, for example: the full URL link for demo on [dhis2.org](http://dhis2.org) <http://apps.dhis2.org/dev/mobile/index.action>. And your mobile browser will automatically detect the DHIS2 application where the server URL is given (e.g.: <http://apps.dhis2.org/dev>). Here is the login form to access the application with user-name and password. Click on "Login" to continue or "Reset" to reset:

A screenshot of a mobile browser displaying a login form for DHIS2. The title bar says 'dhis2'. The main area has a blue header with the word 'Login'. Below it is a 'Username' field containing 'elmer'. Below that is a 'Password' field with several dots visible, outlined in orange. At the bottom are two buttons: 'Login' and 'Reset'.

After logging in, there are the list of functions:

- **Aggregate Reporting:** Entries for aggregate data with defined/assigned dataset by organisation-units

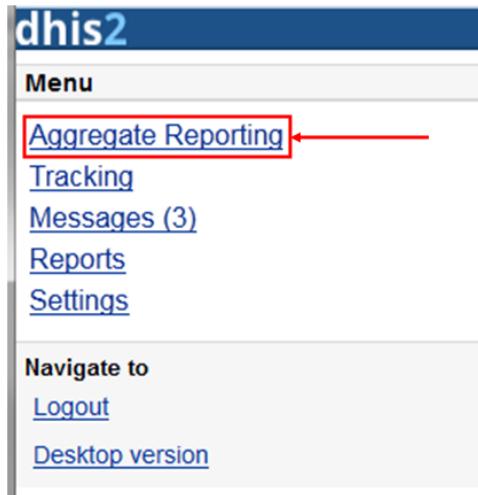

- **Tracking:**

- Find Person: find person based on Name, Phone Number or ID, and Organization unit.
- Activity Plan: Entries data for the persons by organisation-units, persons and programs/program-stages

- Person Registration: Registry a new person
- Anonymous: Entries for anonymous person based on programs
- **Messages:** Manage the messages and discussions from the server. Message reply is available. User can send feedback message in Messages.
- **Reports:** The output reports from the server.
- **Settings:** User-information (e.g.: First-name, Surname, Phone number, E-mail) and the Interface language.
- **Logout:** to log out the application.
- **Desktop version:** navigate to the desktop version of DHIS2 for administration. This require a lot of resources from the client mobile, for example: the sufficient memory to load the pages. Not recommended for the normal GPRS/3G/... phones.

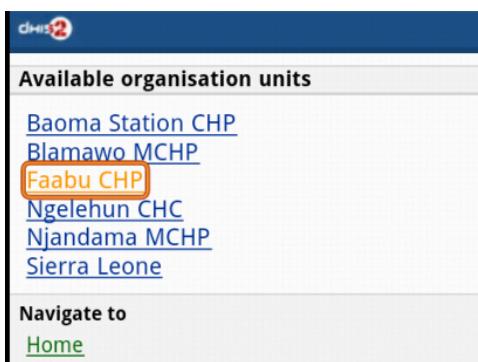

The list above will be explained in details:

- 1. Aggregate Reporting:** Entries for aggregate data with defined/assigned dataset by organisation-units.

Click on the "Aggregate Reporting", then choose an Organisation Unit from the list and the list of the datasets will be appeared for entering aggregate data. See the below example:

#### **Step 1: Select an Organisation Unit from the list**

#### **Step 2: Select a Dataset (entry form) from the list**

**Available data sets**

- [Mortality < 5 years](#)

1	2 ABC	3 DEF	-
4 GHI	5 JKL	6 MNO	.
7 PRQS	8 TUV	9 WXYZ	DEL
* # (	0 +	—	下一个

**Step 5: Save the data entered after completing the data, choose the option for data completeness if having.**

## 2. Tracking: Find/Add Person, Visit Schedule, Person Registration, Anonymous

2.1 *Find/Add Person* : find person based on Name, Phone Number or ID, and Organization unit.

- Step 1: insert Name, Phone Number or ID and select the Organization Unit, then click Search.

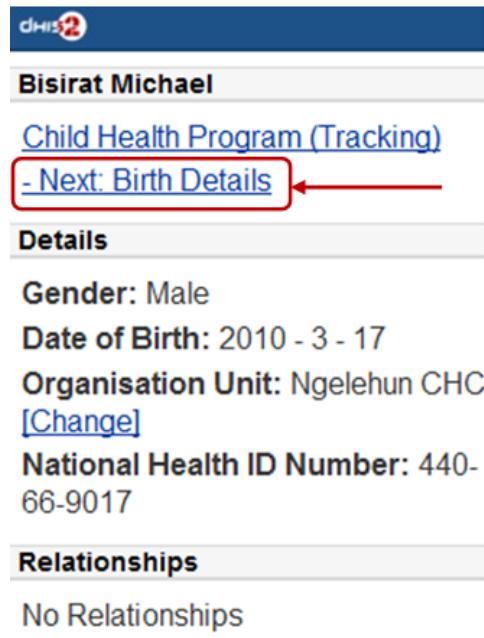

The screenshot shows the dhis2 mobile application's person search interface. At the top, there is a search bar with the placeholder "Search By Name or ID or Phone Number" containing the letters "ra". Below the search bar is a dropdown menu labeled "Select Organisation Unit" with "Ngelehung CHC" selected. A blue "Search" button is located below the dropdown. To the right of the search area, there is a "Navigate to" section with links to "Person Registration", "Tracking Menu", and "Home".

- Step 2: select a person

The screenshot shows the dhis2 mobile application's person list interface. The title "Person List" is at the top. Below it, two names are listed: "Bisirat Michael" and "Nile Bisrat". The name "Bisirat Michael" is highlighted with a red rectangular box and has a red arrow pointing to it from the left. Below the names, the text "Total found: 2" is displayed. To the right of the names, there is a "Navigate to" section with links to "Find Person" and "Home".

Then all the information of that person will be displayed

- Step 3: choose the next program stage for entering the data

Bisirat Michael

[Child Health Program \(Tracking\)](#)

- Next: Birth Details

- Current Activity Plan: the list of the beneficiaries registered, enrolled, not yet finish/complete a/many program and there is at least a program-stage open for data-entry.

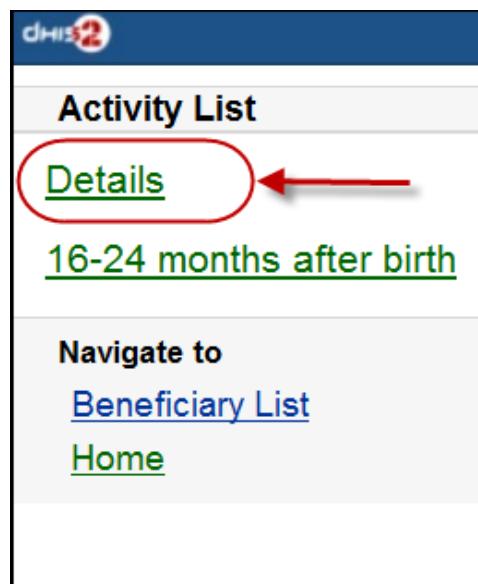

+ Step 1: Choose a Person for entry

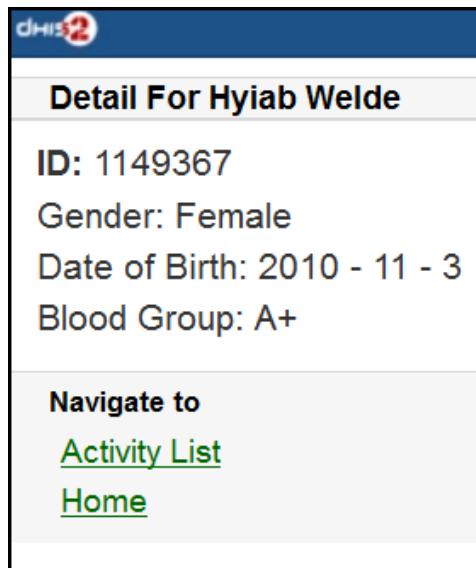

+ Step 2: Choose a current and active program-stage for entering the data

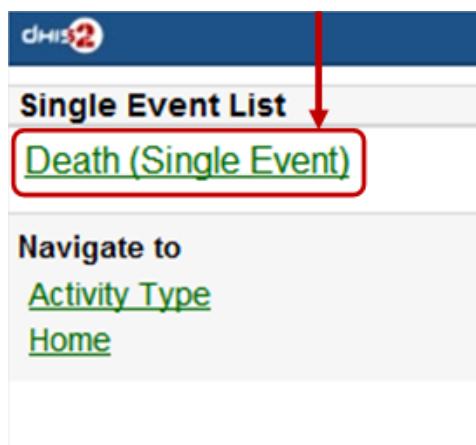

You can also see the person's information (ID, gender, Date of Birth, and Blood Group) by clicking on the Details (on top of the list appeared)

The details information of the chosen person:

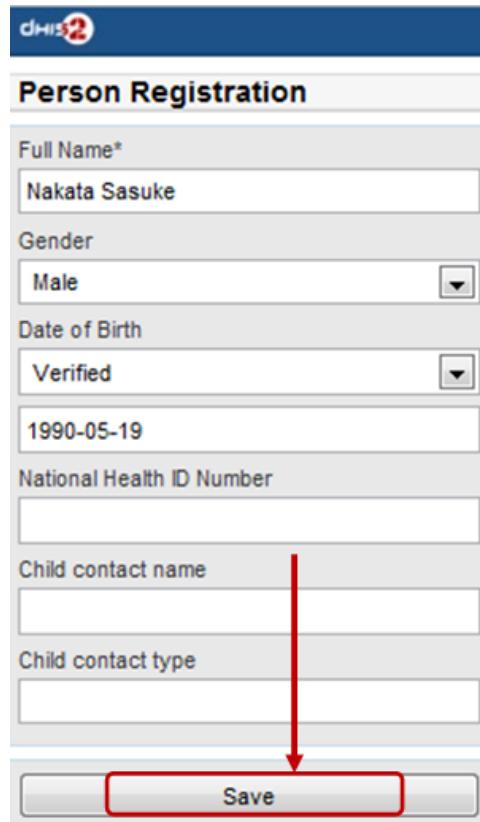

- All Activity Plan: the list of all beneficiaries registered, enrolled, not yet finish/complete a/many program.
- Single Event:

### 2.3: Person Registration: Registry a new Person

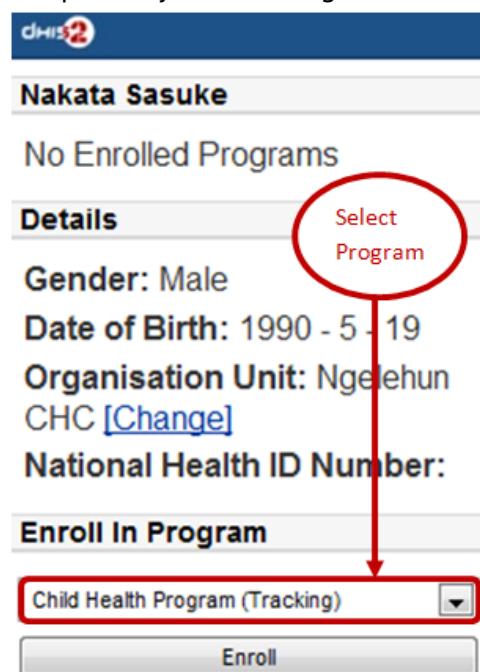

- Step 1: Entry personal information

The screenshot shows the 'Person Registration' screen from a mobile browser. The form includes fields for Full Name (Nakata Sasuke), Gender (Male), Date of Birth (Verified, 1990-05-19), and National Health ID Number (empty). Below these are fields for Child contact name and Child contact type, both also empty. A red arrow points down to the 'Save' button at the bottom.

Full Name*	Nakata Sasuke
Gender	Male
Date of Birth	Verified 1990-05-19
National Health ID Number	
Child contact name	
Child contact type	
<b>Save</b>	

- Step 2: Enroll program for the person just been registered, then click "Enroll".

The screenshot shows the enrollment screen for the registered person. It displays basic details: Gender: Male, Date of Birth: 1990 - 5 - 19, Organisation Unit: Ngelehung CHC [Change], and National Health ID Number (empty). A red circle highlights the 'Select Program' button next to the 'Enroll In Program' button. Another red arrow points down to the 'Enroll' button at the bottom.

<b>Nakata Sasuke</b>

Organisation Unit: Ngelehung  
CHC [\[Change\]](#)  
National Health ID Number:

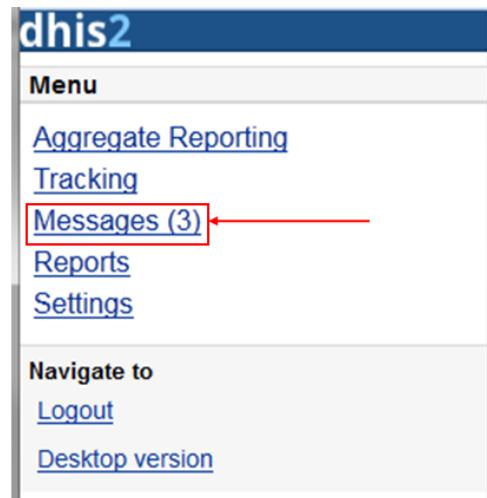

Relationships

No Relationships

2.4: **Anonymous:** Entries for anonymous person based on specific programs

The screenshot shows a mobile browser interface with a blue header bar containing the 'dhis2' logo. Below the header is a title 'Delivery Returns (Anonymous)'. The form consists of several input fields: 'Address' (text input), 'Education' (text input), 'Age \*' (dropdown menu showing '15 - 20'), 'Gender' (dropdown menu showing 'Select Option'), 'Occupation' (text input), and 'Parity' (text input). The entire form is contained within a light gray box.

3. **Messages:** Manage the messages and discussions from the server. Message reply is available.

The number showed is the unread messages. Click on that to view the list of the messages (the unread messages are in bold and dark blue color):

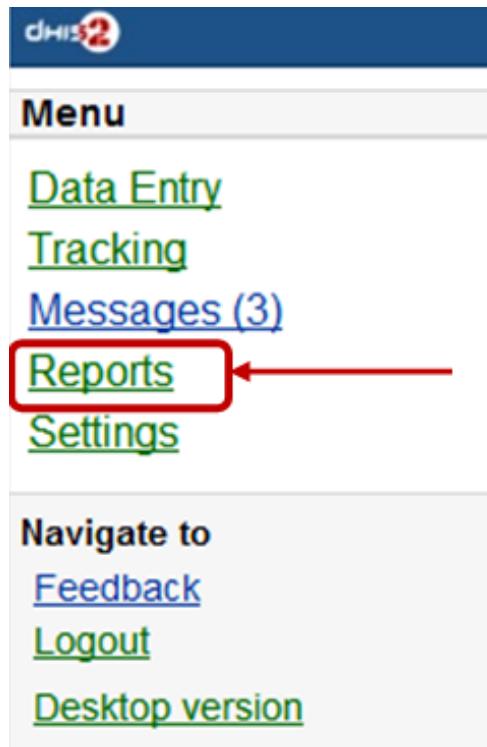

The screenshot shows the dhis2 mobile application interface. At the top, it says "dhis2". Below that is a section titled "Conversations" with a list of messages. One message is highlighted with a red border: "DHIS version 2.7 is deployed". Another message below it is also highlighted: "Where can I do dynamic analysis?". There are other messages in the list: "DHIS version 2.6 deployed on server", "How can I set up my personal dashboard?", and "New reports available". Below the messages is a "Send feedback" section with fields for "Subject \*" and "Text \*", and a "Send" button. At the bottom is a "Navigate to" section with links for "Home" and "Messages".

Then you can pick up the message/topic for the discussions by leaving the reply message, see this example:

The screenshot shows the dhis2 mobile application interface. It starts with a message "DHIS version 2.7 is deployed". Below it is a "Reply" section where the user has typed "thanks!". A red circle highlights the text "thanks!", and a red arrow points from this circle down to the "Send" button. After sending, a new message appears: "Reply from [Administrator DHIS]" containing the text: "Hi all, version 2.7 of DHIS is deployed. It contains a range of new functionality including chart options, translation of database content, locking of data entry forms and pre-defined options in event registration. This messaging functionality now supports marking messages for follow-up, paging of the message list and improved navigation." Below this is a "Navigate to" section with links for "Messages" and "Home".

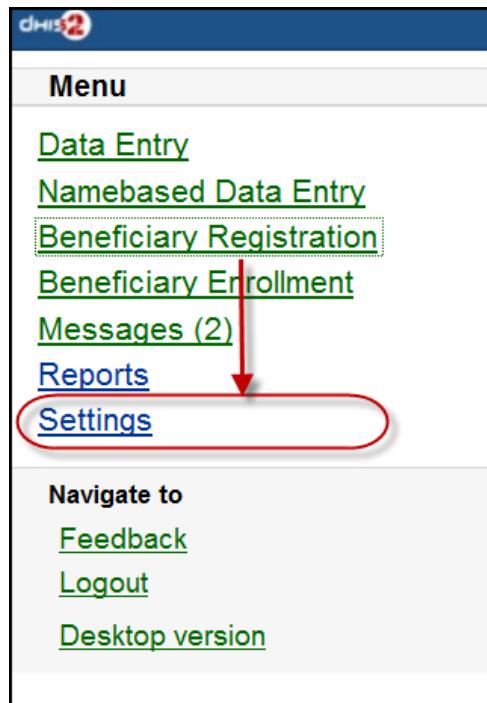

User can create and send a feedback to server in messages section. After sending out the new feedback, the message (feedback) will be listed under "Messages" for further following up.

#### 4. Reports: The output reports from the server

(will be updated)

5. **Settings:** User-information (e.g.: First-name, Surname, Phone number, E-mail) and the Interface language.

Here is the form for setting the user account/access and the interface language. Click on "SAVE" for completing the settings, see the example below:

Settings

[Home](#)

### 3. Beneficiary Enrollment:

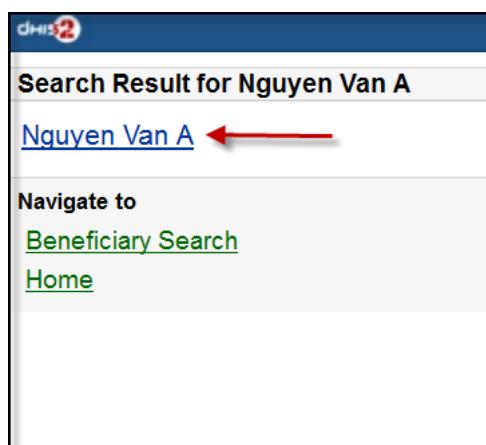

Enroll a beneficiary to one or many programs

Before enrolling a beneficiary to a program, the search function for a beneficiary is provided:

If the beneficiary is found, the result will be listed. The simply click on the beneficiary name for navigating to the programs in which the beneficiary enrolled:

The below screen-shot example describes the beneficiary named "Nguyen Van A":

- Has not enrolled any programs before

- There is one program: "Child Health Program" available for enrollment

The screenshot shows a mobile application interface. At the top, there's a blue header bar with the dhis2 logo. Below it, the main content area has a white background. The title 'Enrolled Program(s) for Nguyen Van A' is displayed. Underneath, there's a section titled 'Other Programs' which lists 'Child Health Program (Tracking)'. At the bottom of this section, there are navigation links: 'Beneficiary Search' and 'Home'.

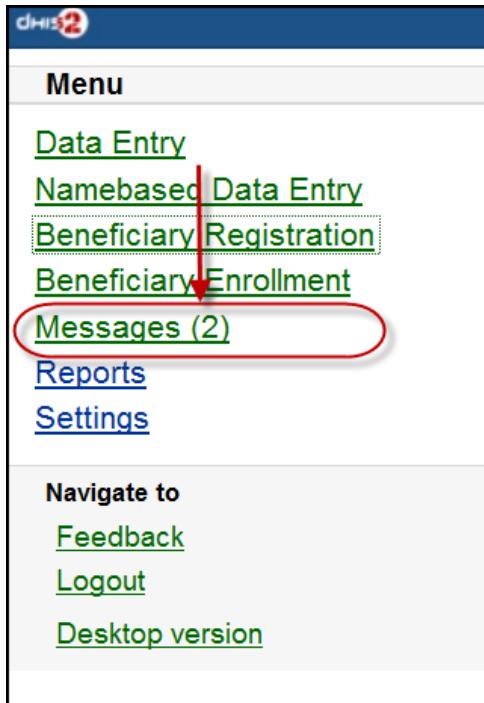

The list of the available programs for enrollment will be listed. Just click on the program for enrollment by specifying the date of enrollment and the date of incident. See the example:

This screenshot shows the 'Enroll' screen for a beneficiary named 'Nguyen Van A'. The title is 'Enroll Nguyen Van A to Child Health Program (Tracking)'. It contains two input fields: 'Enrollment Date [yyyy-MM-dd]' with the value '2012-04-26' and 'Incident Date [yyyy-MM-dd]' with the value '2012-01-01'. Below these fields is a large blue button labeled 'Enrol' with a red arrow pointing towards it. At the bottom, there are navigation links: 'Program List' and 'Home'.

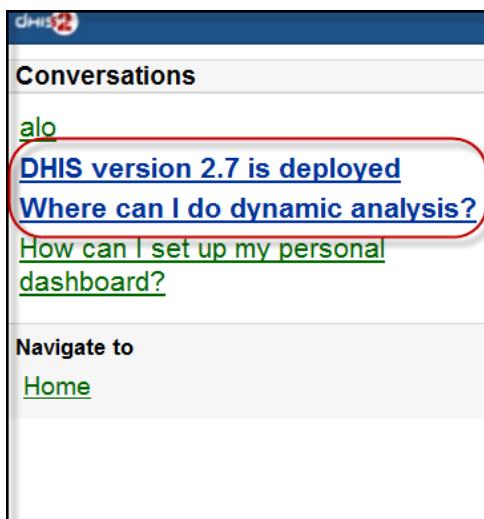

After clicking on the "ENROLL" button, if successful, the program enrolled will be listed under "Enrolled Programs for" + <Name of the beneficiary>, see the example:

This screenshot shows the same 'Enrolled Program(s) for Nguyen Van A' screen as before, but with a different content flow. It starts with a blue header bar with the dhis2 logo. Below it, the main content area has a white background. The title 'Enrolled Program(s) for Nguyen Van A' is displayed. A blue banner at the top says 'Successfully Saved'. Below this, it lists 'Child Health Program (Tracking)' and 'Other Programs'. At the bottom, there are navigation links: 'Beneficiary Search' and 'Home'.

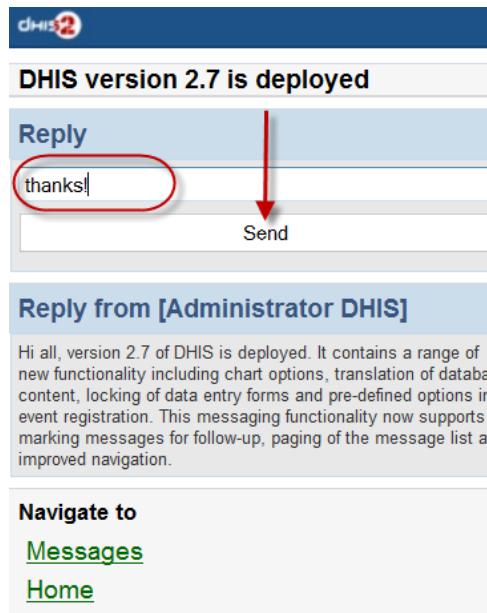

4. **Messages:** Manage the messages and discussions from the server. Message reply is available.

The number showed is the unread messages. Click on that to view the list of the messages (the unread messages are in bold and dark blue color):

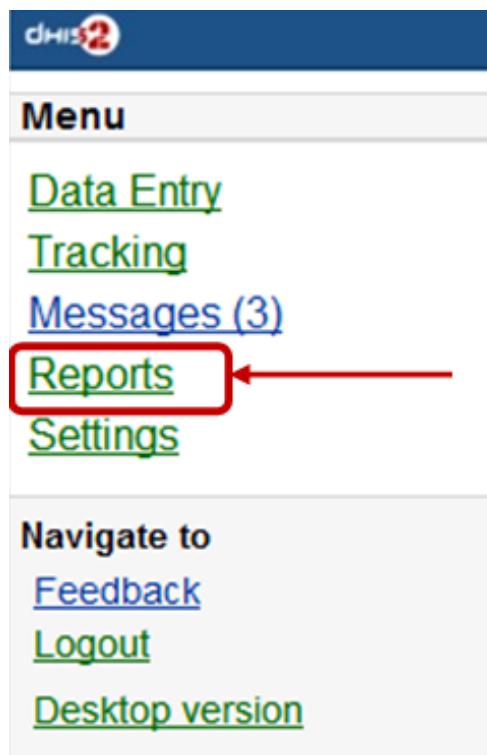

Then you can pick up the message/topic for the discussions by leaving the reply message, see this example:

## 5. Reports:

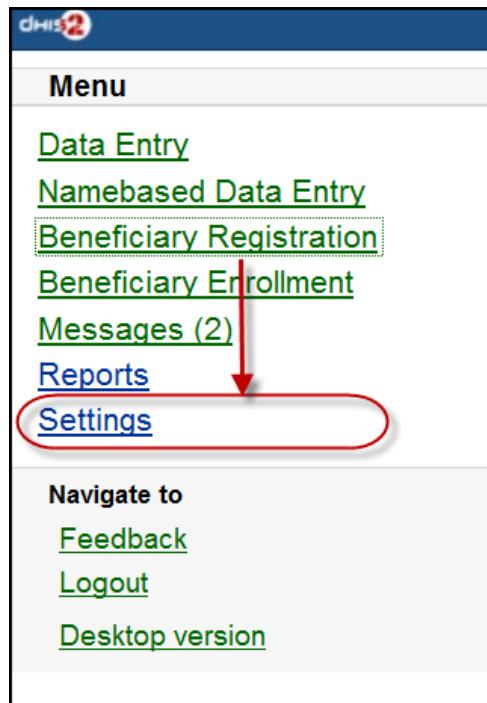

The output reports from the server

(will be updated)

## 6. Settings:

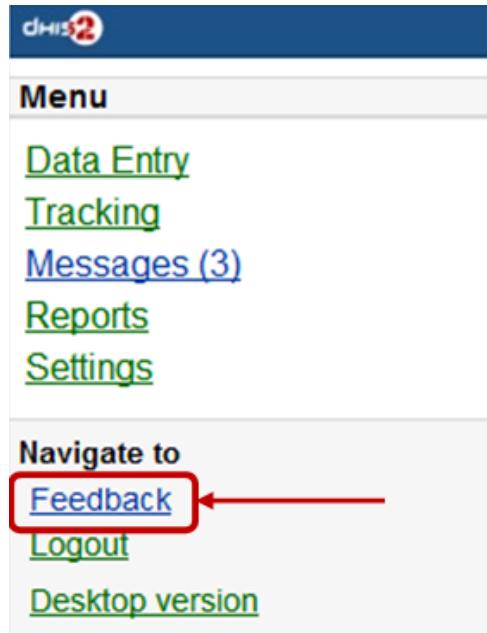

User-information (e.g.: First-name, Surname, Phone number, E-mail) and the Interface language.

Here is the form for setting the user account/access and the interface language. Click on "SAVE" for completing the settings, see the example below:

The screenshot shows the 'Settings' form. At the top, it says 'Settings'. Below that, there are two main sections: 'Update user' and 'Interface Language'. The 'Update user' section contains fields for 'First name \*' (User), 'Surname \*' (Mobile), and 'E-mail'. The 'Interface Language' section shows 'English (United Kingdom)' selected. At the bottom of the form is a 'Save' button. Red boxes highlight both the 'Update user' and 'Interface Language' sections, and a red arrow points from the text 'Click on "SAVE" for completing the settings, see the example below:' down to the 'Save' button.

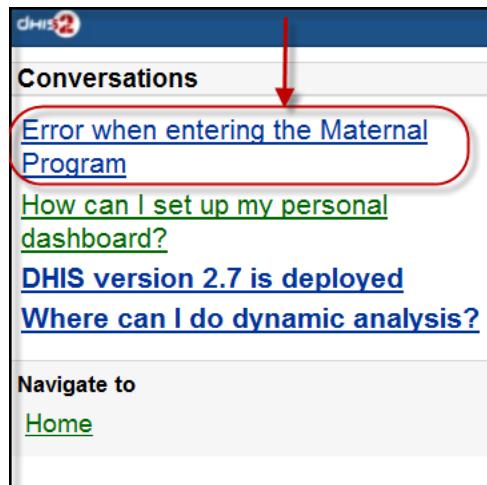

7. **Feedback:** the extra function for creating a new message to send to the server. The new created feedback from this will be listed under "**Messages**"

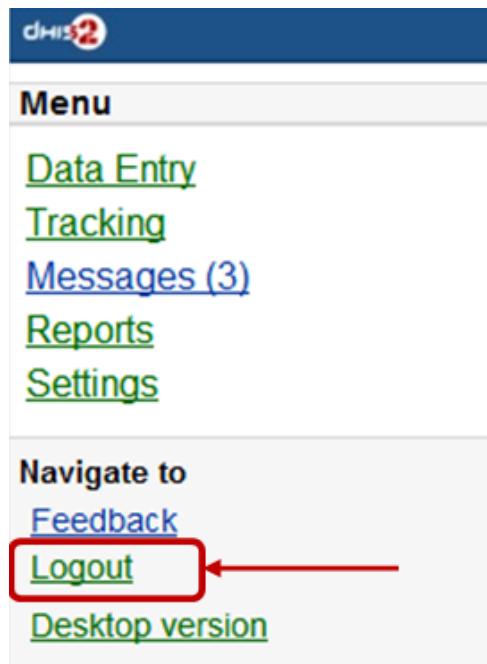

After clicking on the "Feedback", there will be a form for editing/sending out a new message/discussion. See the example below:

The screenshot shows a "Send feedback" form. At the top, it says "Send feedback". Below that is a "Subject \*" field containing "Error when entering the Maternal Program". Below that is a "Text \*" field containing "Can't load the entry form for beneficiaries". At the bottom right of the form is a "Send" button, which has a red arrow pointing to it from the left. Below the form is a "Navigate to" section with a "Home" link.

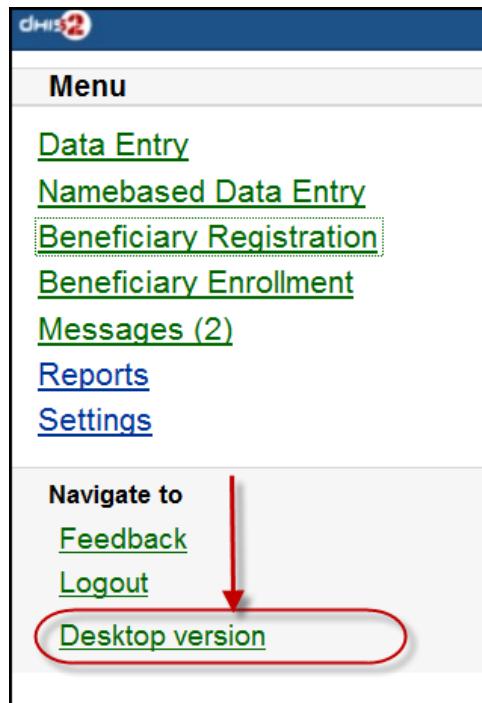

After sending out the new feedback, the message (feedback) will be listed under "Messages" for further following up.

8. **Logout:** to log out the application

9. **Desktop version:** navigate to the desktop version of DHIS2 for administration.

Here is the GUI of the desktop version (which require much memory for loading), not recommended for normal mobile. The example with DHIS2 Demo (from [dhis2.org](http://dhis2.org))

## 28.3. J2ME GPRS/3G Client

The DHIS2 GPRS/3G mobile module provides a mechanism for remote clients using mobile phones to enter data directly into the DHIS2 system. There are two functions of the client, namely:

The solution relies on the mobile phone having a data connection available (i.e. GPRS, Edge, 3G), over which it communicates with a DHIS2 instance which must be publicly available on the internet, as any other web server. The client application on the phone downloads the data entry forms to the phone from the server, and the forms can therefore be updated without installing a new application. This is also a crucial feature for community reporting, which relies on regularly downloading activity plans from the server.

- Facility reporting, for data entry and reporting of regular DHIS2 aggregate data,
- Activity reporting, for supporting individual activity reporting with the Community module.

### 28.3.1. Data connection availability

Data connection availability can be a problem in many of the contexts where DHIS2 mobile reporting would otherwise be a good solution for getting data directly into DHIS2. If that is the case for you, you might want to consider trying the SMS based solution described in a separate document. Keep in mind that even though a data connection is currently required for communication between the server and the mobile phone, it is only required when initializing

or updating the mobile application and when sending reports to the server. The phone stores all entered data locally, so it can work fine with only temporary access to a data connection on a regular basis.

### 28.3.2. J2ME GPRS 3G facility reporting client

The server side component of the web based solution is included in the general build of DHIS2.

In order to configure the DHIS2 web-based mobile reporting, you should follow the following steps.

- Set the "Available for Mobile Reporting" flag for the data sets you want reported: Under *Maintenance->DataSet->Edit* mark the "Available for Mobile Reporting" check box and save.
- Create a user role for the mobile user. Select *Maintenance->Users->User Role->Add new*. Add a user role name and description. Add the desired data sets for the role. The mobile user role will need to have at least privileges for DHIS2 Web API. Save the user role by clicking "Save".
- Create a user which will be used by the client to login from *Maintenance->Users->User ->Add new*. Fill in all of the required details, keeping in mind that the password must be at least 8 digits long, contain one capital letter, and one digit. Assign the desired user role to the user which was created in the previous step.

#### Important

Assign the user to exactly **one** organisation unit. Each mobile reporting client will need their own user name and password.

### 28.3.3. Detailed configuration of data sets and reporting forms

Though the previous steps is all that should be needed for testing the solution more detail configuration of the datasets may be required and are described in the following sections.

#### 28.3.3.1. The mapping of data sets to form layout on the phone

By default, a data set is mapped to a single form on the phone. If the data set is divided into sections, each section is displayed as a separate page on the phone. If a data element has more than one category option combo it will be displayed as a heading with the category combination options following.

**Table 28.1.**

Form design element	DHIS2 Metadata	Metadata element
Form title	Data set	Short Name if it exists, otherwise Name
Page tile	Section	Section name (or form name if no sections)
Question	Data element	Alternative name if it exists, otherwise Name
Question name if combos	Category option combo	name

#### 28.3.3.2. Sorting of forms

By default, data elements will be sorted according to the global sorting assigned in DHIS2. If sections are used, their section specific sorting order will be used. In some cases, when

sections are not used, a data element might be used in multiple data sets, and conflict in the way it should be sorted in individual data sets. A work around for this situation is to wrap the whole dataset in one section (note that this will only work if the data elements have the same category option combo)

### 28.3.3.3. Versioning of data sets

To make it possible to compare and update the data sets on the mobile phone with the version on the server, data sets are automatically versioned when you edit the data set structure. Some changes which occur on the DHIS2 server, will cause the mobile client to update its forms with a new version.

#### Changes that currently trigger a new data set version

- Create DataSet
- Edit DataSet
- Create/edit/delete Section in DataSet
- Sort Section Order
- Update DataElement (affect many related DataSets)
- Delete DataElement (affect many related DataSets)
- Edit DataElement Category
- Edit DataElement Category Combo

### 28.3.3.4. Language support

Multi-language support is available.

DataSet and DataElement are translated through web-based function. Default language on server is used on mobile in cases requested language from mobile is not available.

Dataset management

Filter by name:		Sort	Add new
<input type="text"/>	<input type="button" value="Filter"/>	<input type="button" value="Clear"/>	
		Operations	
Name	Aggregation Dataset		
No. of pages:	1	No. of rows per page:	50
		Jump to page:	1
		<input type="button" value="Go"/>	
« « 1 » »			

## 28.3.4. Mobile application setup

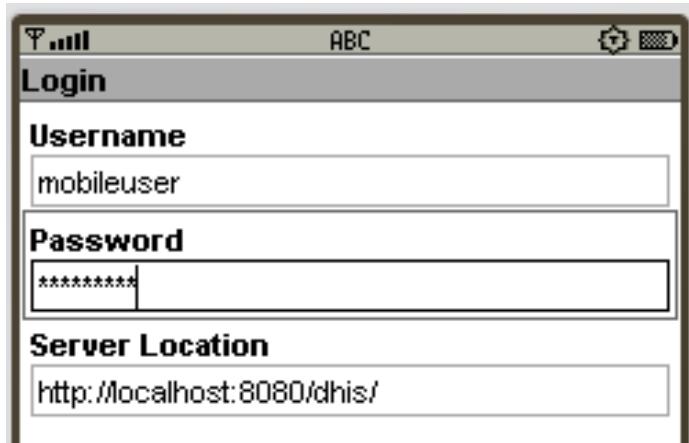

### 28.3.4.1. Installation and initialization

#### 28.3.4.1.1. Installation

Download the jar packages from the DHIS2 homepage: [www.dhis2.org/downloads](http://www.dhis2.org/downloads)

#### 28.3.4.1.2. Initialization

Initialization should be performed before the phones are delivered end-users. Given the large variation in possible phone configurations, it is impossible to describe the exact steps which are required in order to enable the client on the phone. However, for most phones, simply copying the DHIS2 Web Mobile client "JAR" file to the phone with a USB cable or via Bluetooth is sufficient. Of course, GPRS/3G connectivity must be enabled. Contact your mobile service provider for exact details on the configuration of the phones and networks.

Once the client has been installed on the phone, an initialization process must occur by providing a user name, password and server URL.

#### 1. Logging into the server for the first time.

The first time the client logins to the server, or if the client is reinitialized, the username, password and server URL must be entered.

If the client is unable to login, there could be several possible error messages which you see.

- Connection Not Found: The specified server URL is not correct. Check the server address, ensure that the server is actually reachable, and try again.
- Invalid User Name Or Password: the username or password is incorrect
- Application not authorized to access restricted APIs : The server can be contacted, but the user does not have the necessary permissions to access the mobile reporting module

#### 2. Setting the PIN number: After the initial login process, a PIN number can be entered by the user. This will make the login process much easier, as the user only has to remember the four digit pin number, as opposed to typing in the user name and password each time. The PIN number can be preset if the phone is initialized prior to delivery, or it can be set by the users themselves if they have been provided with usernames and passwords.

After entering the PIN, press (Menu)->Next.

#### 3. Download all forms: After the PIN has been specified, all forms will be downloaded from the server and stored locally on the phone..

If the user has been configured to report on aggregate datasets, a list of appropriate datasets will be displayed. If the user is responsible for community based reporting, the list of assigned activities is displayed.

Notes: If the Health Worker is responsible for both Facility Reporting and Community Reporting, DHIS2 server will send all forms of both Facility Reporting and Community Reporting to mobile and on mobile, there will be a screen to choose whether displaying Facility Reporting or Community Reporting.

Errors:

### 28.3.4.2. Logging in (for regular use)

After starting the application, the PIN form is displayed.

- PIN: Enter the four digit number PIN.
- Reinitialize Command: this function will clear all data on mobile and we start from the login screen with username and password.
- Errors: Invalid PIN: If the user has entered an invalid PIN, they will need to enter the correct PIN, or reinitialize the application with the correct username and password.

### 28.3.4.3. Facility Reporting Module

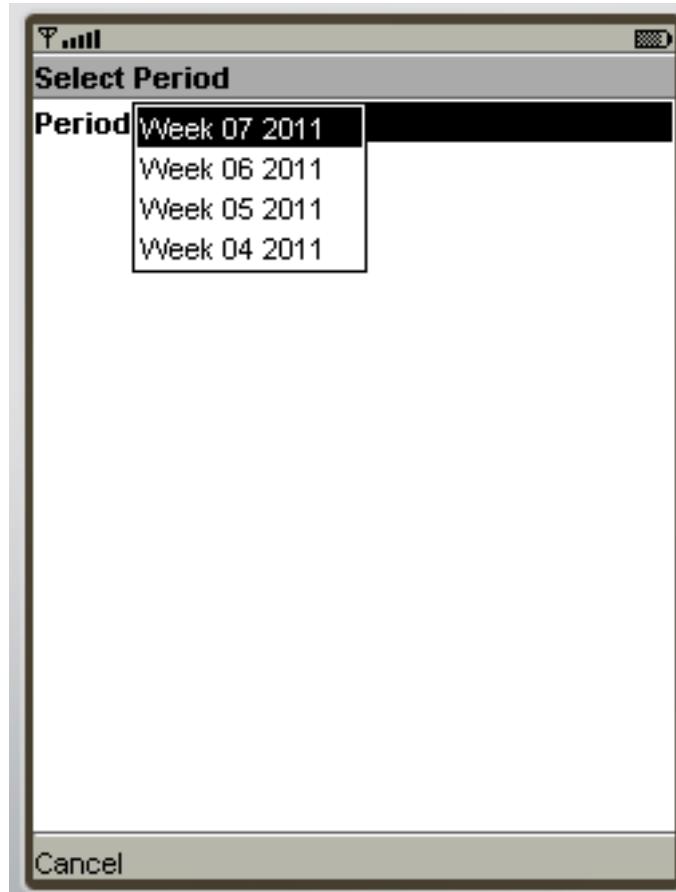

#### 28.3.4.3.1. Entering data

After selecting an aggregate dataset from the "Select report form" window, the user will need to select an appropriate time period. A list of available time periods is automatically generated.

1. After the user has entered their PIN, they can select from a list of available datasets. Select the appropriate dataset and press "Next".

2. Choosing periods: A list of available periods will be automatically displayed to the user. They can select the appropriate period from the list.

3. Fill in values: After choosing the period, the form can be displayed in two modes, depending on the

- Form with sections

Each form section is displayed in a single screen with the name of the section in the title window.

To navigate from screen to screen, push "Next".

- Forms without section (Datasets without sections)

All fields are displayed on one screen with the title that is the name of DataSet

The user simply fills in each data element with the appropriate value.

The screenshot shows a mobile application interface with the following data entries:

- Can refills: 6
- Number ITNs: 7
- People protected: 832
- Rooms found: 56
- Rooms sprayed: 1243
- Sachets used: 89
- Unsprayed rooms locked: (empty)

At the bottom are "Close" and "Menu" buttons.

#### 4. Save and Complete:

After finishing data entry, the user can choose to save the data locally on the phone or to upload the data directly to the DHIS2 server.

The screenshot shows the same mobile application interface as above, but with a context menu overlayed on the right side. The menu has a purple background and contains the following options:

- 1 Save
- 2 Complete

If the user saves the data form, they can edit the form at a later point in time if they need to. When selecting a period once again, the period will be marked as "Saved" as seen in the next screen shot.

If the user selects "Complete", and the data entry form is not complete, the user will be asked if they are certain they wish to submit the form as incomplete. Once the form has been submitted, a message should be displayed informing the user that the transmission was successful.

#### 28.3.4.3.2. Notes

##### 1. Period list:

Periods marked with an asterisk (\*) is the period that is completed or saved, depending on the status of the data entry.

All periods that are not in period list are considered old and will be deleted automatically.

##### 2. Storing values duration

The number of saved forms on mobile are limited only by the effective amount of storage of the mobile device.

Forms are saved for limited period only, depending on the frequency of collection of the particular dataset.

- Daily Forms: 2 months (current and previous month)
- Weekly Forms: 4 weeks (current and 3 previous week)

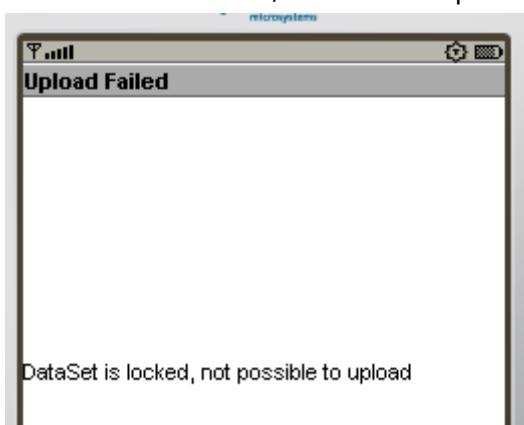

- Monthly Forms: 2 months (current and previous month)
- Quarterly Forms: 2 quarters (current and previous quarter)
- Yearly Forms: 2 years (current and previous year)

### 3. Completed forms - Uneditable forms

If the form has been completed, the user can view the form on their phone, but they cannot make any subsequent edits to the form. Each field is greyed out and inactive for editing.

### 4. Re-Edit completed forms

If the user wishes to edit data which has already been submitted to the server, they can do so by pressing the "Edit" button. They are allowed to do this assuming that the dataset has not been locked for the period in question. If they attempt to upload the data, the user will be informed that the dataset has been locked, and it is not possible to upload the data.

### 5. Update Forms:

This function is used to synchronize the forms on mobile and on server. The process is automatically triggered after entering PIN number.

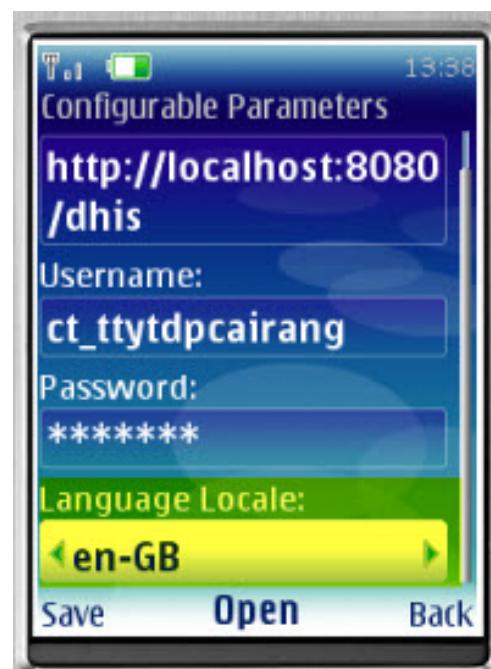

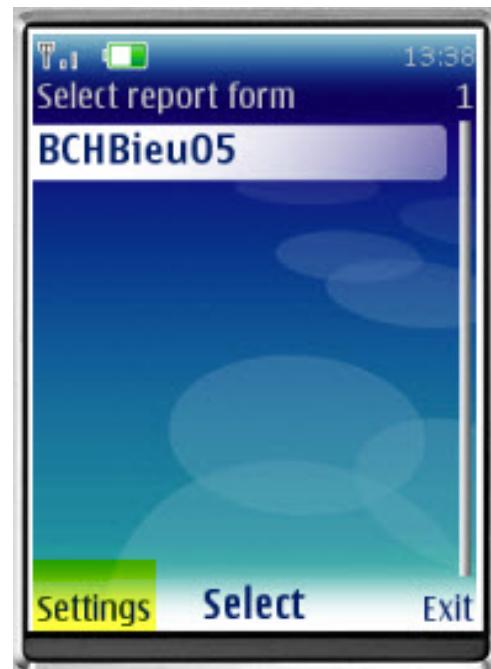

Note: Checking and downloading updated forms process run in background. After finished, prompt is displayed to ask user whether refresh form list or stay where they are.

### 6. Multi-Language Support:

This function help user to choose language of mobile's GUI (graphical user interface) and content's language (Forms).

The forms must be translated on server, otherwise, default language is used.

Default language of first login is English. Change language in Setting menu will affect both interface and content.

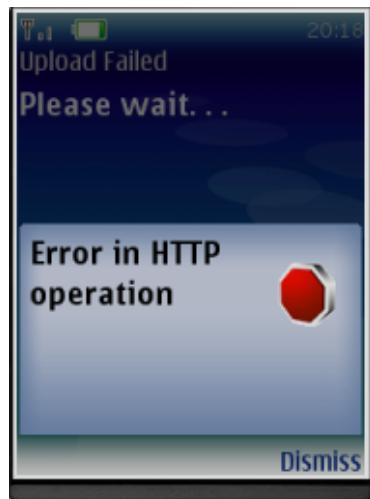

**Multi-Language Interface:** In Setting menu, there are list of supported language (downloaded from server). Language of GUI is only changed after restart application.

**Multi-Language Content (forms):** Form's language is change after click "Save". In case there are many forms, it take several minutes to save setting.

#### 28.3.4.3.3. Troubleshooting

- Data has been entered on the phone but does not appear on the server

This usually occurs when users enter data on the phone, but cannot send it to the server. This may be because of the configuration of the phone, lack of credit on the phone, or lack of coverage. Usually an error message is displayed as shown below.

Users should be informed that if they see this error, then it means that their data has not been transmitted.

## 28.4. SMS Command

SMS command feature helps DHIS2 system receiving SMS from users, patients, or even anonymous. A SMS command is an object containing the configurations for each SMS form: reporting data from phones or j2me apps, alerting users, registering patient or user, etc.

## 28.4.1. Set up SMS command

This is where you can create a new SMS command

Usually each SMS command has its own property, then the setting up process may be different from each other. Currently, we have 4 types of SMS command:

With KEY\_VALUE\_PARSER and J2ME\_PARSER, the SMS command will have dataset because those are used for reporting data

With ALERT\_PARSER and UNREGISTERED\_PARSER, the SMS command will have user group because those are used for sending message such as SMS, DHIS2 conversation, email.

There are certain parameters which are common to all SMS Command types. These parameters have default values configured in the system, if user does provide any value to these parameters then those default ones will be used. Here is the list of those parameters

**Table 28.2. Common Parameters**

Parameter	Type	Description
Code and value Separator	String	To provide custom code value separator. Default is "="
Reply message	String	To provide message if no code is found in SMS text input. Default is "Parameter missing"

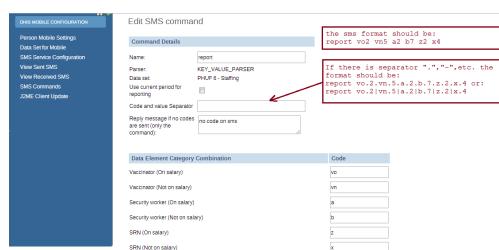

Parameter	Type	Description
if no codes are sent (only the command)		
Wrong format message	String	To provide message if command is not formatted correctly. Command should be fomatted as per code value separator. This message will also be sent back if any mandatory parameter is missing.
No user message	String	To provide message if sending phone number is not registered in DHIS 2.
User belong to more than one OrgUnit message	String	Certain SMS command types require user ( retrieved from sending phone number ) to be associated with only one organization unit. This message can be configured to be sent back in case that requirement is not fulfilled.
Success Message	String	To provide message that will be sent upon successful completion of the process.

## 28.4.2. SMS Command Type

The SMS command is basically defined by its parser type. In other word, each SMS command has one unique parser to parse the plain text SMS, then the result will be used for the purpose of that SMS command.

### 28.4.2.1. SMS Command for Reporting Data

In order to report data for example data set (aggregation), we use SMS commands which have KEY\_VALUE\_PARSER (for phone's plain text), or J2ME\_PARSER (for j2me apps)

If the command has name "report", and a list of data element with code like above. The format should be: [command's name] [code][value] [code][value] [code][value]....,the [value] of course might be changed depends on real data, so you have to preapre a SMS text like this example: **report vo2 vn5 a2 b6 z3 x1**

In case the command has a separator for instance ".", the SMS text should be:

**report vo.2.vn.5.a.2.b.6.z.3.x.1**

or **report vo.2|vn.5|a.2|b.6|z.3|x.1**

Moreover in SMS text input, orgUnit can be specified like this **org orgUnitCode** If no orgUnit is specified in SMS then user is retrieved first from the sending phoneNumber and then orgUnit from that user. As far as PeriodType is concerned it should be specified in this format "ddMM" for example 3108, but in case its not specified then PeriodType will be retrieved from DataSet attached to SMSCommand

With the J2ME\_PARSER, you don't need to prepare those SMS text, because the J2ME will do this job

**Command Details**

Name: report

Parser: KEY\_VALUE\_PARSER

Data set: Population

Completeness method: Receive all data value

Use current period for reporting

Code and value Separator:

Reply message if no codes are sent (only the command):

Wrong format message:

No user message:

User belong to more than one OrgUnit message:

Success Message:

User can set the custom response message for "Wrong format message", "No User Message", "User belong to more than one OrgUnit message" and "Success message". If no custom message is being set, system will use the default message.

#### 28.4.2.2. SMS Command for Alerting, Registering

In order to alert users or register patients, users, we use SMS commands which have ALERT\_PARSER (for phone's plain text), or UNREGISTERED\_PARSER (for j2me apps)

**Command Details**

Name: wmt

Parser: ALERT\_PARSER

User Group: Feedback Message Recipients

Confirm Message: your SMS has been received and forwarded

Reply message if no codes are sent (only the command): wmt?

Save Back

The SMS format should be:  
alert one emergency case in A town

The format of those command will be: [command's name] [text], for example:

**alert one emergency case in A town**

Commands which has ALERT\_PARSER will be received from users only

#### 28.4.2.3. SMS Command for Event Registration

Event Registration can be used to register anonymous event into the system based on the data collected through SMS. This command type is associated with Programs of type WITHOUT\_REGISTRATION. For example Birth events can be tracked using this parser.

Data set: Receive all data value

Completeness method: Receive all data value

Use current period for reporting

Code and value Separator:

Reply message if no codes are sent (only the command):

Wrong format message:

No user message:

User belong to more than one OrgUnit message:

Success Message:

**Program Stage Data Elements**

Gender: G

Height in cm: H

Age in years: A

Documentation: D

Save Cancel

The format of those command will be: [command's name] [code][separator][value], for example:

**birth A=1,B=2,G=Male**

Code/Value separator is configurable. Comma "," is by default taken as field separator. Commands which has EVENT\_REGISTRATION\_PARSER will be received from DHIS2 users only. Once command is successfully received then data received in SMS will be parsed and event will be registered in DHIS2.

## 28.5. SMS Service

SMS Service is a generic service used for sending/receiving SMS. Any other DHIS2 module can include this service and utilize it to send and receive SMS from users or workers in the field.

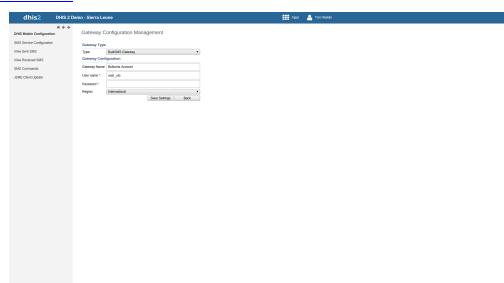

### 28.5.1. Setting up SMS service

There are few pre-requisites in order to make this service functional. There are two ways to complete these steps. One way is to configure gateway from the GUI in Mobile Configuration Module. The other way is to use SMS Web Api.

- Configure SMS Gateway

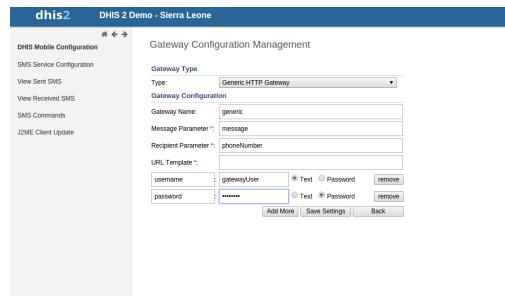

#### 28.5.1.1. Configure SMS Gateway

There are five different types of Gateways supported by SMS Service. SMS can be sent if any one of the gateway is configured. If more than one gateways are present, then they will be used in round-robin fashion for load balancing. There are different parameters for different type of gateway. The Gateway can be configured in GUI in Mobile Configuration Module as shown in the figure. More information about parameters needed to configure gateway can be found in [Gateway Configurations](#)

#### 28.5.1.2. Configure GenericHttp Gateway

Many DHIS2 instances are using GenericHttpGateway to connect to their local gateways. These local gateways provides HTTP APIs for sending SMS. In new GenericHttpGateway it is now possible to configure url parameters provided in their APIs. For example `http://gateway.com/sendMessage?username=AA&password=xxxxxx&message=testing&msisdn=9999`. In this url username, password, message, msisdn are parameters that are required by external gateways. Now in GenericHttp these parameters are configurable which was not possible in previous releases. Making is configurable will help DHIS2 to interact with other gateways which have different url formats.

## 28.5.2. Gateway Configurations

Below table shows the parameters required for configuring gateway.

**Table 28.3. Gateway Configuration Parameters**

Parameter	BulkSMS Gateway	Clickatell Gateway	Generic HTTP Gateway	Description
Gateway Name	Optional	Optional	Optional	Used as gateway identity. Default name will be stored in case this parameter is not configured. Its use is recommended
User Name	Required	Optional (if token is used)	Required	Used for API authentication
Password	Required	Optional (if token is used)	Required	Used for API authentication
Auth-Token	N/A	Optional password (if is used)	N/A	Used for API authentication
MessageParameter	N/A	N/A	Required	Message query parameter. For example http://gateway.com?message=Hi
RecipientParameter	N/A	N/A	Required	Recipient query parameter. For example http://gateway.com?phoneNumbers
URL Template	N/A	N/A	Required	Url Tempalte is only required in case of GenericHttpGateway For example "http://smsgateway1.com"
Headers	N/A	N/A	Optional	Header option can be checked to send selected parameter as

<b>Parameter</b>	<b>BulkSMS Gateway</b>	<b>Clickatell Gateway</b>	<b>Generic HTTP Gateway</b>	<b>Description</b>
				http header. For example username/ password/token can be sent in http header.

# Chapter 29. DHIS2 Tutorials

## 29.1. Create Scorecards using the Pivot Table app

*Scorecards definition: In public health settings such as Ministries of Health, scorecards offer a useful and standardized method for combining related indicators into one table. A scorecard gives an overall view of the performance of a health program such as a vaccination program, highlighting successes, weaknesses, and areas for improvement. Here's what a typical scorecard looks like:*

ANC 1 Coverage	ANC 2 Coverage	ANC 3 Coverage	ANC => 4 Coverage	ANC IPT 1 Coverage	ANC IPT 2 Coverage
Oct to Dec 2016 + Jul to Sep 2016 +	Oct to Dec 2016 + Jul to Sep 2016 +	Oct to Dec 2016 + Jul to Sep 2016 +	Oct to Dec 2016 + Jul to Sep 2016 +	Oct to Dec 2016 + Jul to Sep 2016 +	Oct to Dec 2016 + Jul to Sep 2016 +
136.6	165.2	119.1	155	120.3	94.8
54.5	88.8	51.3	75.2	36.3	59
35.8	118	35.4	117.6	30.1	84.3
77.4	84.7	83.3	84.1	72.2	71.7
109.4	97.7	95.3	94.8	65.6	65.8
93.5	90	117	106.3	86.7	87.7
37.7	84.4	28.9	70	20.5	51.7
26.6	57.4	25.2	55.3	15.9	43.9
108	123.1	97.9	111.6	83.9	96.1
64.2	112.1	57.7	95.5	36.6	57.1
0.71	113.1	1.1	106.6	0.74	82
139.6	135	114.4	104.2	67.6	60.4
122.2	123.7	111.8	112.9	72.3	83.8
				66.2	63.3
				119.6	155.6
				115.2	128.9

This tutorial explains how to create a scorecard in the DHIS2 Pivot Table app. There are several advantages to using the Pivot Table to create a scorecard, such as:

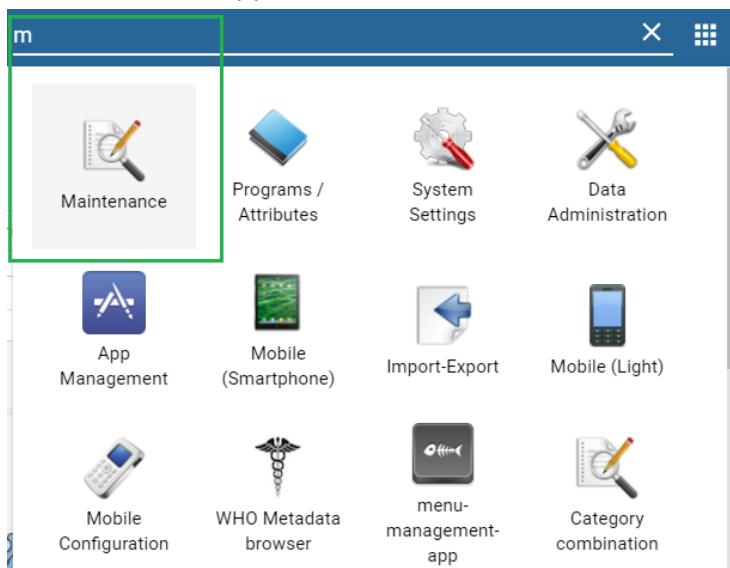

- You can save the scorecard on the dashboard and use it offline.
- You can share the scorecard with other DHIS2 users.

Let's get started!

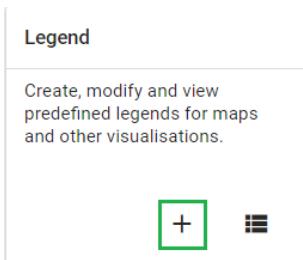

### 29.1.1. Create a legend for your scorecard

First, we'll create a 3-color "traffic light" legend for the scorecard. With three basic colors, the scorecard is easy to scan and easy to understand.

1. Open the **Maintenance** app. Click the menu in the top right corner and select Maintenance from the list of apps. You can also type the first letters of the word maintenance in the search field to find the app.

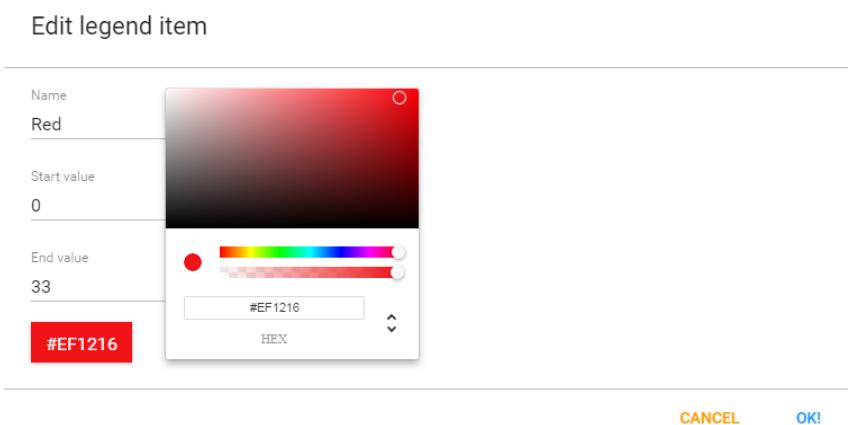

2. In the Maintenance app, scroll to the bottom of the page right down to the **Other** section.
3. Go to **Legend** and click the **+**.

- In the **Legend Management** page, scroll to the bottom of the page and create a new legend by clicking the blue + button.

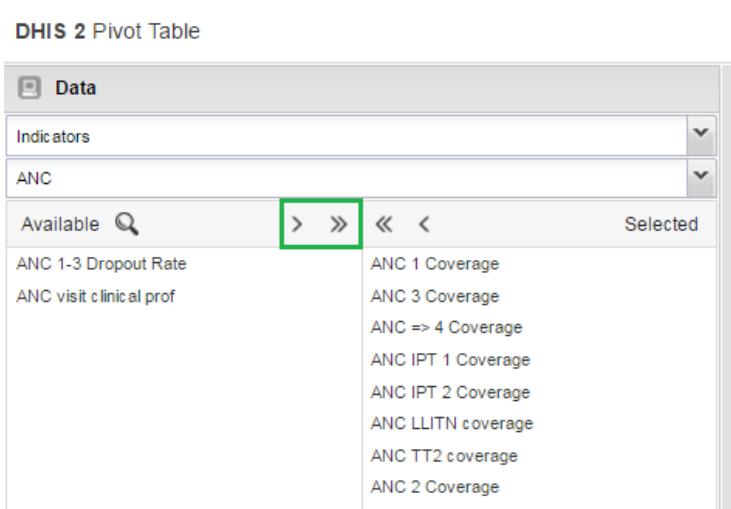

- Enter a name for the legend such as "Traffic light", a start value and an end value in the fields. The values you enter here depend on the performance ratings you wish to set for the scorecard.
- Change **Number of legend items** to 3 to display three colors in the scorecard. To change the legend item colors, click the blue + button and then edit the colors.

## 29.1.2. Create a scorecard in the Pivot Table app

- Open the **Pivot Table** app from the top right menu of the dashboard. You can also enter the first letters of Pivot Table in the search field.
- Go to **Data** in the pane on the left side and select **Indicators** in the list.
- Select an **Indicator group** such as "ANC" in the second list.
- Using the arrows, select the type of indicators you want to see in your scorecard.

- Click **Update**. This button is in the menu at the top of the workspace

6. Go to **Periods** and select a period for which you want to display data. In this “traffic light” example, we’ll use the relative period section. In **Quarters**, select **This quarter** and **Last quarter**. Clear any other checkboxes and click **Update**.

DHIS 2 Pivot Table

**Weeks**

- This week
- Last week
- Last 4 weeks
- Last 12 weeks
- Last 52 weeks

**Quarters**

- This quarter
- Last quarter
- Last 4 quarters

**Years**

- This year
- Last year
- Last 5 years

**Months**

- This month
- Last month
- Last 3 months
- Last 6 months
- Last 12 months

**Bi-months**

- This bi-month
- Last bi-month
- Last 6 bi-months

**Six-months**

- This six-month
- Last six-month
- Last 2 six-months

**Financial years**

- This financial year
- Last financial year
- Last 5 financial years

7. Go to **Organisation Units** in the same left side pane, and click the arrow next to the gear button.

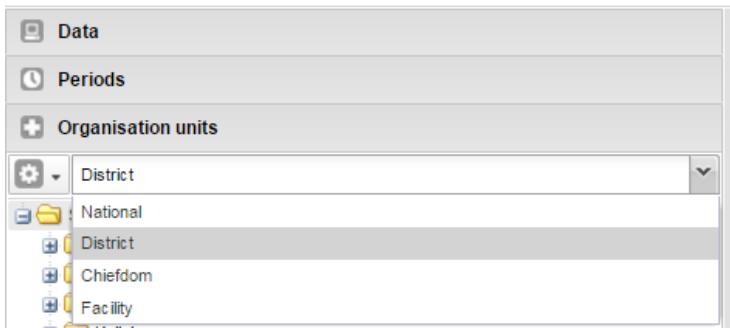

8. Select **Select levels**.

DHIS 2 Pivot Table

**Selection mode**

- Select organisation units
- Select levels
- Select groups

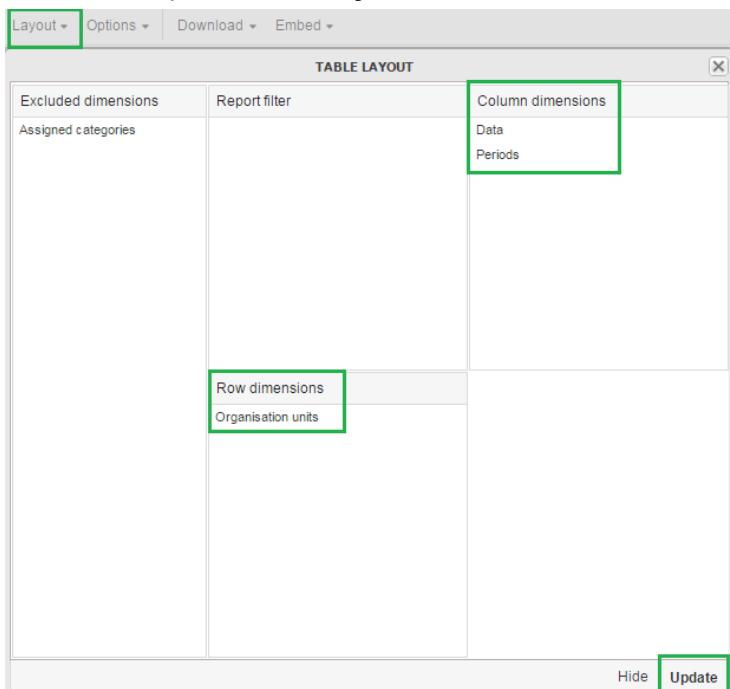

9. Select **District** from the list (next to the gear button). Click **Update**.

**DHIS 2 Pivot Table**

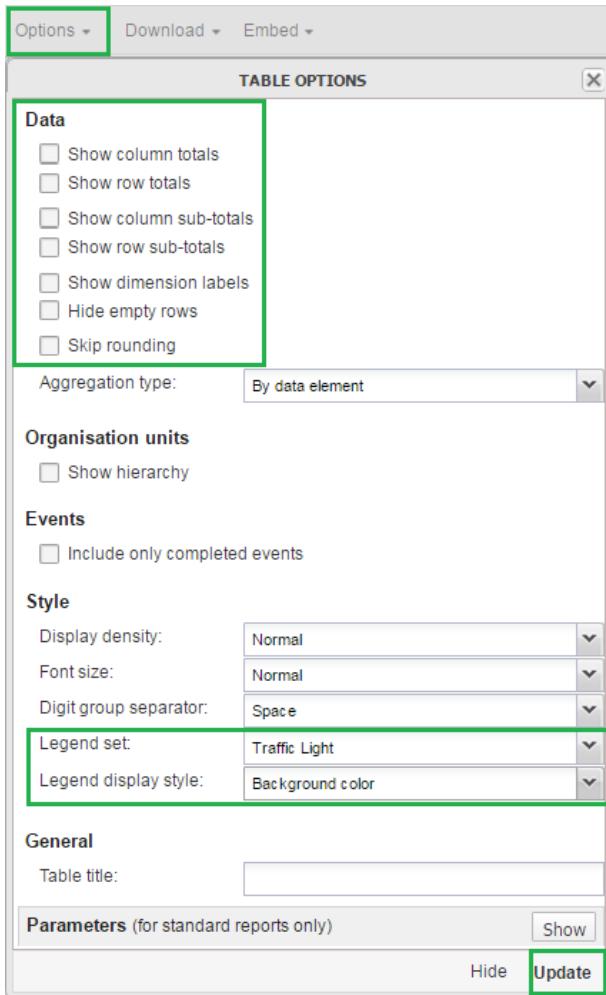

As you can see, the scorecard is starting to take shape in the workspace. Now it's time to fine-tune the look and feel.

### 29.1.3. Organise the layout and display of your scorecard

1. In the workspace, click **Layout**.

2. In **Table layout**, drag **Organisation units** down to the **Row dimensions** section.
3. Drag **Data** to the **Column dimensions** section.
4. In the **Column dimensions** pane, drag **Periods** below **Data**, and click **Update**.
5. In the workspace, click **Options**.

6. Go to **Data** and clear all the checkboxes.
7. Go to **Style > Legend set** and from the list, select the legend you created in the Maintenance app. In this example, we called it Traffic light.
8. Go to **Style > Legend display style** and select **Background color**.
9. Click **Update**.

The Scorecard is ready!

ANC 1 Coverage		ANC 2 Coverage		ANC 3 Coverage		ANC => 4 Coverage		ANC IPT 1 Coverage		ANC IPT 2 Coverage	
Oct to Dec 2016	Jul to Sep 2016	Oct to Dec 2016	Jul to Sep 2016	Oct to Dec 2016	Jul to Sep 2016	Oct to Dec 2016	Jul to Sep 2016	Oct to Dec 2016	Jul to Sep 2016	Oct to Dec 2016	Jul to Sep 2016
136.6	165.2	119.1	155	120.3	94.8	63.2	51.9	127.1	91.5	111.5	70.8
54.5	88.8	51.3	75.2	36.3	59	17.6	30.2	98.7	72.7	74.9	60.2
35.8	118	35.4	117.6	30.1	84.3	22.1	55.4	125.5	107.6	73.2	83.2
77.4	84.7	83.3	84.1	72.2	71.7	45.8	49.1	130.1	83	104.2	78.3
109.4	97.7	95.3	94.8	65.6	65.8	33.9	29.1	120.7	78.7	118.7	57.8
93.5	90	117	106.3	86.7	87.7	57.5	56	94.3	93.1	54.7	65.4
37.7	84.4	28.9	70	20.5	51.7	16.1	38.4	112.5	114.3	103.7	107.4
26.6	57.4	25.2	55.3	15.9	43.9	5.8	29.1	85	95.7	45.8	61.8
108	123.1	97.9	111.6	83.9	96.1	76.7	82	104.4	108	96.2	97.2
64.2	112.1	57.7	95.5	36.6	57.1	20.3	31.6	168.3	162.2	128	138.1
0.71	113.1	1.1	106.6	0.74	82	0.13	48.3	223.8	143.6	118.2	116.6
139.6	135	114.4	104.2	67.6	60.4	28.2	25	127.8	96.8	96.7	90
122.2	123.7	111.8	112.9	72.3	83.8	66.2	63.3	119.6	155.6	115.2	128.9

## 29.1.4. Save and share your scorecard

1. In the workspace, go to the **Favorites** menu.
2. Click **Save as**. Enter a name for your Scorecard.
3. To share your Scorecard, select **Favorites**.
4. Enter the name of a user group name, and click **Save**. Your scorecard can be viewed by people that you share a dashboard with.

# Chapter 30. About demo server, live package and database design

## 30.1. Using the DHIS2 demo server

The DHIS2 team maintains a demonstration server at <https://play.dhis2.org/demo>. This is by far the easiest way to try out DHIS2. Simply open the link in your web browser and login with username = admin and password = district.

### Note

All changes on this server are deleted each night, so do not save any important work on this server. It is strictly for demonstration purposes only!

## 30.2. Using the DHIS2 live package

### 30.2.1. Starting the DHIS2 Live package

The DHIS2 Live package is the easiest way to get started with DHIS2 on your local computer. DHIS2 Live is appropriate for a stand-alone installation and demos. Simply download the application from [here](#). Once the file is downloaded, you can simply double-click the downloaded file, and get started using DHIS2.

#### 30.2.1.1. Prerequisites for DHIS2 Live

You must be sure that you have a current version of the Java Runtime installed on your machine. Depending on your operating system, there are different ways of installing Java. The reader is referred to this [website](#) for detailed information on getting Java installed.

#### 30.2.1.2. Starting up with a blank database

The live package comes with a demo database just like what you see on the [online demo](#) (which is based on the national Sierra Leone HMIS), and if you want to start with a blank system/database and build up your own system then you need to do the following:

- 1) Stop DHIS2 live if it is already running. Right click on the tray icon and select Exit. The tray icon is the green symbol on the bottom right of your screen (on Windows) which should say 'DHIS2 Server running' when you hover your mouse pointer over the icon.
- 2) Open the folder where the DHIS2 live package is installed and locate the folder called "conf".
- 3) In conf/ open the file called 'hibernate.properties' in a text editor (notepad or similar) and do the following modification: locate the string 'jdbc:h2:./database/dhis2' and replace the 'dhis2' part with any name that you want to give to your database (e.g. dhis2\_test).
- 4) Save and close the hibernate.properties file.
- 5) Start DHIS2 Live by double-clicking on the file dhis2-live.exe in the DHIS2 Live installation folder or by using a desktop shortcut or menu link that you might have set up.
- 6) Wait for the browser window to open and the login screen to show, and then log in with username: admin and password: district

7) Now you will see a completely empty DHIS2 system and you should start by adding your users, organisational hierarchy, data elements, and datasets etc. Please refer to the other sections of the user manual for instructions on how to do this.

### 30.2.2. Downloading and installing the server version

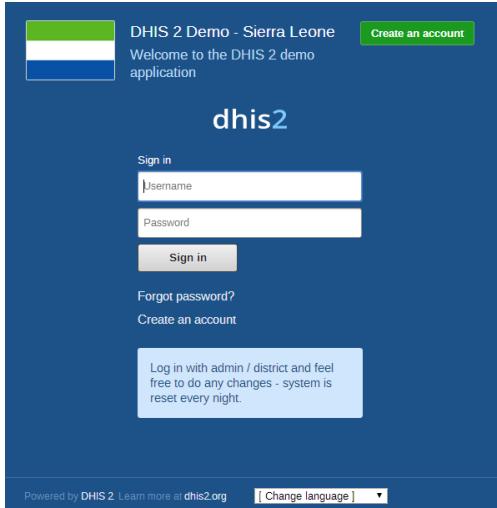

The latest stable server version can be downloaded from this [website](#). For detailed information on how to install it please refer to the installation chapter in the implementation manual.

### 30.3. Logging on to DHIS2

Regardless of whether you have installed the server version of the desktop Live version, you will use a web-browser to log on to the application. DHIS2 should be compatible with most modern web-browsers, although you will need to ensure that Java Script is enabled.

To log on to the application just enter <http://localhost:8080/dhis> if you are using the DHIS2 live package, or replace localhost with the name or IP address of the server where the server version is installed.

Once you have started DHIS2, either on-line or off-line, the displayed screen will prompt you to enter your registered user-name and password. After entering the required information click on log-in button to log into the application. The default user name and password are 'admin' and 'district'. They should be changed immediately upon logging on the first time.

You can select the language which you wish to display DHIS2 in from the "Change language" dialog box at the bottom of the screen. Not all languages may be available.

Should you have forgotten your password, you can click on the "Forgot password?" link. You must have informed DHIS2 of your email address and the server must be properly configured to send emails.

If you want to create your own account (and the server administrator allows this), simply click "Create an account" and follow the directions provided.

Once you have logged into DHIS2, refer to the specific sections in this manual for the different functionality which is available.

### 30.4. Logging out of DHIS2

Just click on the Profile and the click "Log out" the top-right corner of the DHIS2 menu.

## 30.5. Quick intro to designing a DHIS2 database

DHIS2 provides a powerful set of tools for data collection, validation, reporting and analysis, but the contents of the database, e.g. what to collect, who should collect it and on what format will depend on the context of use. However, in order to do anything with DHIS2, you must first create meta-data. Meta-data, or data about the data, describes what should be collected (data elements and categories), where it should be collected (organisation units) and how frequently it should be collected (periods). This meta-data needs to be created in the DHIS2 database before it can be used. This can be done through the user interface and requires no programming or in-depth technical skills of the software, but does require a good understanding of the processes which you are trying to collect data from.

This section will provide a very quick and brief introduction to DHIS2 database design and mainly explain the various steps needed to prepare a new DHIS2 system for use. How to do each step is explained in other chapters, and best practices on design choices will be explained in the implementers manual. Here are the steps to follow:

1. Set up an organisational hierarchy
2. Define data elements
3. Define data sets and data entry forms
4. Define validation rules
5. Define indicators
6. Define report tables and design reports
7. Set up the GIS module
8. Design charts and customise the dashboard

### 30.5.1. The organisational hierarchy

The organisational hierarchy defines the organisation using the DHIS2, the health facilities, administrative areas and other geographical areas used in data collection and data analysis. This dimension to the data is defined as a hierarchy with one root unit (e.g. Ministry of Health) and any number of levels and nodes below. Each node in this hierarchy is called an organisational unit in DHIS2.

The design of this hierarchy will determine the geographical units of analysis available to the users as data is collected and aggregated in this structure. There can only be one organisational hierarchy at the same time so its structure needs careful consideration. Additional hierarchies (e.g. parallel administrative groupings such as "Facility ownership") can be modelled using organisational groups and group sets, however the organisational hierarchy is the main vehicle for data aggregation on the geographical dimension. Typically national organisational hierarchies in public health have 4-6 levels, but any number of levels is supported. The hierarchy is built up of parent-child relations, e.g. a Country or MoH unit (the root) might have e.g. 8 parent units (provinces), and each province again (at level 2) might have 10-15 districts as their children. Normally the health facilities will be located at the lowest level, but they can also be located at higher levels, e.g. national or provincial hospitals, so skewed organisational trees are supported (e.g. a leaf node can be positioned at level 2 while most other leaf nodes are at level 5).

Typically there is a geographical hierarchy defined by the health system. e.g. where the administrative offices are located (e.g. MoH, province, district), but often there are other administrative boundaries in the country that might or might not be added, depending on how its boundaries will improve data analysis. When designing the hierarchy the number of children for any organisational unit may indicate the usefulness of the structure, e.g. having one or

more 1-1 relationships between two levels is not very useful as the values will be the same for the child and the parent level. On the other extreme a very high number of children in the middle of the hierarchy (e.g. 50 districts in a province) might call for an extra level to be added in between to increase the usefulness of data analysis. The lowest level, the health facilities will often have a large number of children (10-60), but for other levels higher up in the hierarchy approx. 5-20 children is recommended. Too few or too many children might indicate that a level should be removed or added.

Note that it is quite easy to make changes to the upper levels of the hierarchy at a later stage, the only problem is changing organisational units that collect data (the leaf nodes), e.g. splitting or merging health facilities. Aggregation up the hierarchy is done based on the current hierarchy at any time and will always reflect the most recent changes to the organisational structure. Refer to the chapter on Organisation Units to learn how to create organisational units and to build up the hierarchy.

### 30.5.2. Data Elements

The Data Element is perhaps the most important building block of a DHIS2 database. It represents the "WHAT" dimension, it explains what is being collected or analysed. In some contexts this is referred to an indicator, but in DHIS2 we call this unit of collection and analysis a *data element*. The data element often represents a count of something, and its name describes what is being counted, e.g. "BCG doses given" or "Malaria cases". When data is collected, validated, analysed, reported or presented it is the data elements or expressions built upon data elements that describes the WHAT of the data. As such the data elements become important for all aspects of the system and they decide not only how data is collected, but more importantly how the data values are represented in the database, which again decides how data can be analysed and presented.

It is possible to add more details to this "WHAT" dimension through the disaggregation dimension called data element categories. Some common categories are Age and Gender, but any category can be added by the user and linked to specific data elements. The combination of a data element's name and its assigned category defines the smallest unit of collection and analysis available in the system, and hence describes the raw data in the database. Aggregations can be done when zooming out of this dimension, but no further drill-down is possible, so designing data elements and categories define the detail of the analysis available to the system (on the WHAT dimension). Changes to data elements and categories at a later stage in the process might be complicated as these will change the meaning of the data values already captured in the database (if any). So this step is one of the more decisive and careful steps in the database design process.

One best practice when designing data elements is to think of data elements as a unit of data analysis and not just as a field in the data collection form. Each data element lives on its own in the database, completely detached from the collection form, and reports and other outputs are based on data elements and expressions/formulas composed of data elements and not the data collection forms. So the data analysis needs should drive the process, and not the look and feel of the data collection forms. A simple rule of thumb is that the name of the data element must be able to stand on its own and describe the data value also outside the context of its collection form. E.g. a data element name like "Total referrals" makes sense when looking at it in either the "RCH" form or the "OPD" form, but on its own it does not uniquely describe the phenomena (who are being referred?), and should instead be called "Total referrals from Maternity" or "Total referrals from OPD". Two different data elements with different meanings, although the field on the paper form might only say "Total referrals" since the user of the form will always know where these referrals come from. In a database or a repository of data elements this context is no longer valid and therefore the names of the data elements become so important in describing the data.

Common properties of data elements can be modelled through what is called data element groups. The groups are completely flexible in the sense that they are defined by the user,

both their names and their memberships. Groups are useful both for browsing and presenting related data, but can also be used to aggregate data elements together. Groups are loosely coupled to data elements and not tied directly to the data values which means they can be modified and added at any point in time without interfering with the raw data.

### 30.5.3. Datasets and data entry forms

All data entry in DHIS2 is organised through the use of Datasets. A Dataset is a collection of data elements grouped together for data collection, and in the case of distributed installs they also define chunks of data for export and import between instances of DHIS2 (e.g. from a district office local installation to a national server). Datasets are not linked directly to the data values, only through their data elements and frequencies, and as such a dataset can be modified, deleted or added at any point in time without affecting the raw data already captured in the system, but such changes will of course affect how new data will be collected.

A dataset has a period type which controls the data collection frequency, which can be daily, weekly, monthly, quarterly, six-monthly, or yearly. Both which data elements to include in the dataset and the period type is defined by the user, together with a name, short name, and code.

In order to use a dataset to collect data for a specific orgunit you must assign the orgunit to the dataset, and this mechanism controls which orgunits that can use which datasets, and at the same time defines the target values for data completeness (e.g. how many health facilities in a district expected to submit RCH data every month).

A data element can belong to multiple datasets, but this requires careful thinking as it may lead to overlapping and inconstant data being collected if e.g. the datasets are given different frequencies and are used by the same orgunits.

#### 30.5.3.1. Data entry forms

Once you have assigned a dataset to an orgunit that dataset will be made available in Data Entry (under Services) for the orgunits you have assigned it to and for the valid periods according to the dataset's period type. A default data entry form will then be shown, which is simply a list of the data elements belonging to the dataset together with a column for inputting the values. If your dataset contains data elements with categories such as age groups or gender, then additional columns will be automatically generated in the default form based on the categories. In addition to the default list-based data entry form there are two more alternatives, the section-based form and the custom form.

##### 30.5.3.1.1. Section forms

Section forms allow for a bit more flexibility when it comes to using tabular forms and are quick and simple to design. Often your data entry form will need multiple tables with subheadings, and sometimes you need to disable (grey out) a few fields in the table (e.g. some categories do not apply to all data elements), both of these functions are supported in section forms. After defining a dataset you can define its sections with subsets of dataelements, a heading and possible grey fields in the section's table. The order of sections in a dataset can also be defined. In Data Entry you can now start using the Section form (should appear automatically when sections are available for the selected dataset). You can switch between default and section forms in the top right corner of the data entry screen. Most tabular data entry forms should be possible to do with sections forms, and the more you can utilise the section forms (or default forms) the easier it is for you. If these two types of forms are not meeting your requirements then the third option is the completely flexible, although more time-consuming, custom data entry forms.

##### 30.5.3.1.2. Custom Forms

When the form you want to design is too complicated for the default or section forms then your last option is to use a custom form. This takes more time, but gives you full flexibility in

term of the design. In DHIS2 there is a built in HTML editor (FcK Editor) for the form designer and you can either design the form in the UI or paste in your HTML directly using the Source window in the editor. In the custom form you can insert static text or data fields (linked to data elements + category) in any position on the form and you have complete freedom to design the layout of the form. Once a custom form has been added to a dataset it will be available in data entry and used automatically. You can switch back to default and section (if exists) forms in the top right corner of the data entry screen.

### 30.5.4. Validation rules

Once you have set up the data entry part of the system and started to collect data then there is time to define data quality checks that help to improve the quality of the data being collected. You can add as many validation rules as you like and these are composed of left and right side expressions that again are composed of data elements, with an operator between the two sides. Typical rules are comparing subtotals to totals of something. E.g. if you have two data elements "HIV tests taken" and "HIV test result positive" then you know that in the same form (for the same period and organisational unit) the total number of tests must always be equal or higher than the number of positive tests. These rules should be absolute rules meaning that they are mathematically correct and not just assumptions or "most of the time correct". The rules can be run in data entry, after filling each form, or as a more batch like process on multiple forms at the same time, e.g. for all facilities for the previous reporting month. The results of the tests will list all violations and the detailed values for each side of the expression where the violation occurred to make it easy to go back to data entry and correct the values.

### 30.5.5. Indicators

Indicators represent perhaps the most powerful data analysis feature of the DHIS2. While data elements represent the raw data (counts) being collected the indicators represent formulas providing coverage rates, incidence rates, ratios and other formula-based units of analysis. An indicator is made up of a factor (e.g. 1, 100, 100, 100 000), a numerator and a denominator, the two latter are both expressions based on one or more data elements. E.g. the indicator "BCG coverage <1 year" is defined a formula with a factor 100, a numerator ("BCG doses given to children under 1 year") and a denominator ("Target population under 1 year"). The indicator "DPT1 to DPT3 drop out rate" is a formula of  $100 \% \times (\text{DPT1 doses given} - \text{DPT3 doses given}) / (\text{DPT1 doses given})$ .

Most report modules in DHIS2 support both data elements and indicators and you can also combine these in custom reports, but the important difference and strength of indicators versus raw data (data element's data values) is the ability to compare data across different geographical areas (e.g. highly populated vs rural areas) as the target population can be used in the denominator.

Indicators can be added, modified and deleted at any point in time without interfering with the data values in the database.

### 30.5.6. Report tables and reports

Standard reports in DHIS2 are a very flexible way of presenting the data that has been collected. Data can be aggregated by any organisational unit or orgunit level, by data element, by indicators, as well as over time (e.g. monthly, quarterly, yearly). The report tables are custom data sources for the standard reports and can be flexibly defined in the user interface and later accessed in external report designers such as iReport or through custom HTML reports. These report designs can then be set up as easily accessible one-click reports with parameters so that the users can run the same reports e.g. every month when new data is entered, and also be relevant to users at all levels as the organisational unit can be selected at the time of running the report.

## 30.5.7. GIS

In the integrated GIS module you can easily display your data on maps, both on polygons (areas) and as points (health facilities), and either as data elements or indicators. By providing the coordinates of your organisational units to the system you can quickly get up to speed with this module. See the GIS section for details on how to get started.

## 30.5.8. Charts and dashboard

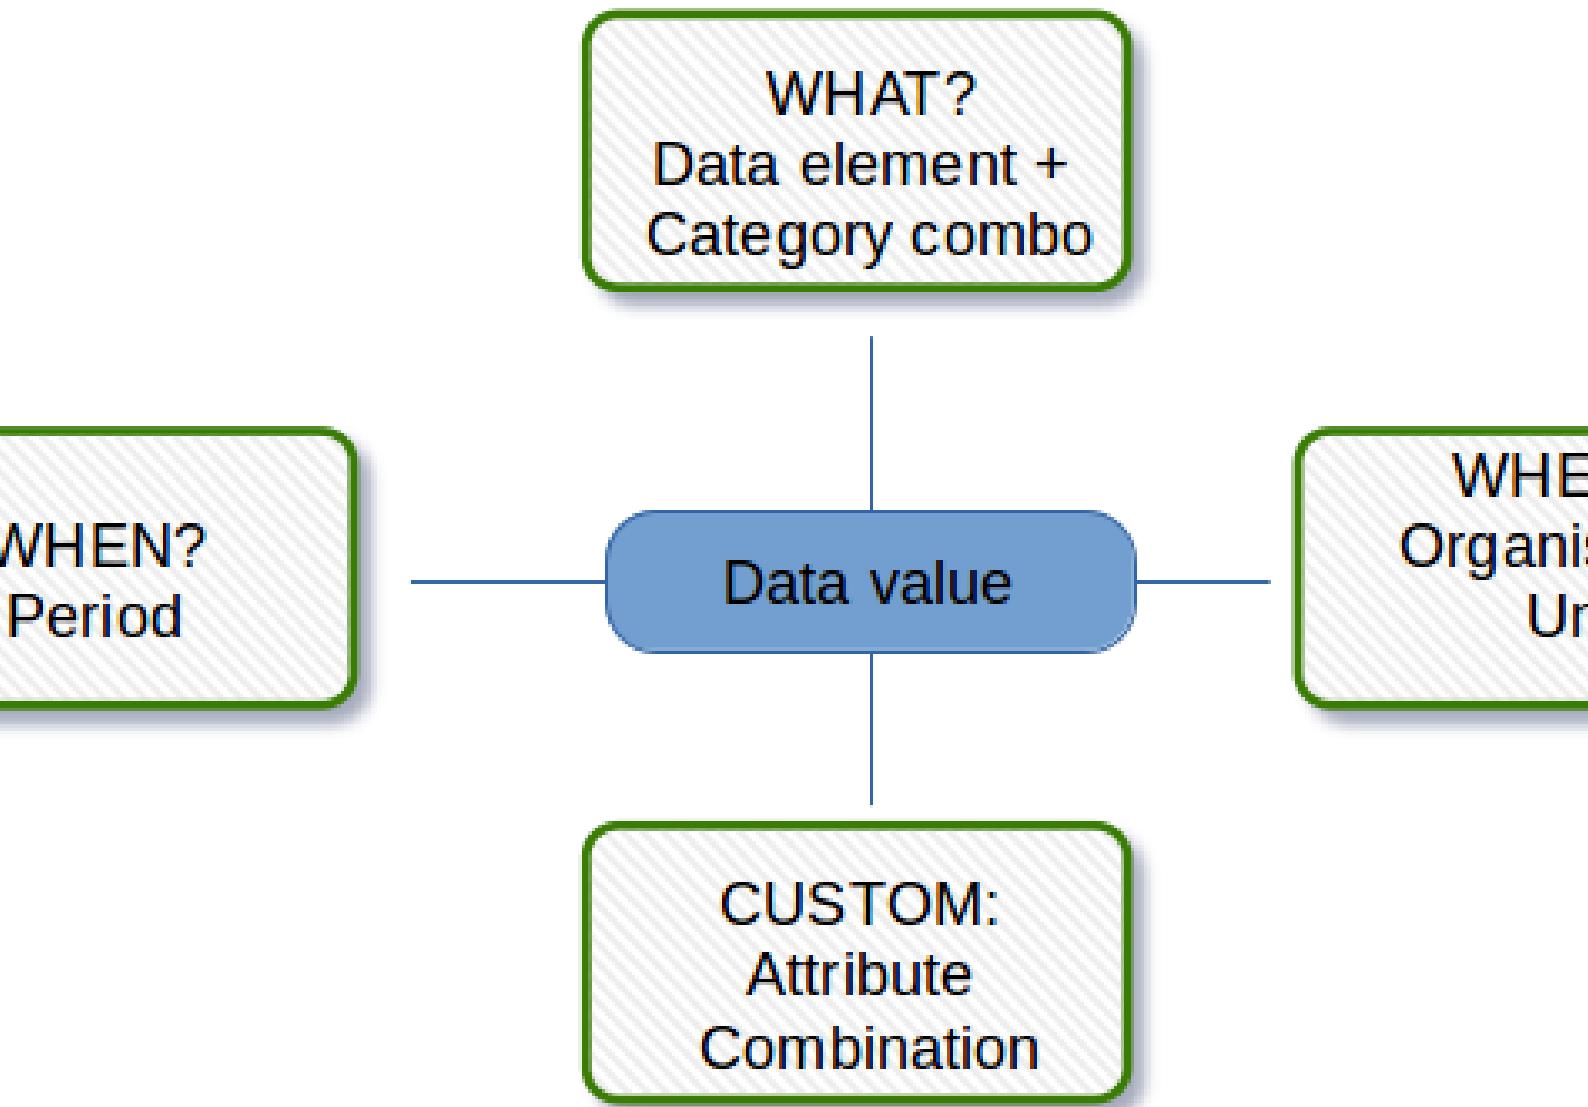

One of the easiest way to display your indicator data is through charts. An easy to use chart dialogue will guide you through the creation of various types of charts with data on indicators, organisational units and periods of your choice. These charts can easily be added to one of the four chart sections on your dashboard and there be made easily available right after log in. Make sure to set the dashboard module as the start module in user settings.

# Chapter 31. About data dimensions in DHIS2

## 31.1. Data dimensions: Core building blocks in DHIS2

A data value in DHIS2 is described by at least three dimensions: 1) data element, 2) organisation unit, and 3) period. These dimensions form the core building blocks of the data model.

As an example, if you want to know how many children that were immunised for measles in Gerehun CHC in December 2014, the three dimensions which describe that value are the Data Element "Measles doses given", the Organisation Unit "Gerehun CHC", and the Period "December 2014". All data values have at least these three dimensions describing What, Where and When.

In addition to the organisation unit, period and data element dimensions, data values may also be associated with a custom dimension consisting of attributes. A common use of this dimension is to describe data values which are reported by multiple partners in the same location for the same data element and time period. In principle, it can be used as a "free-form" dimension, to describe multiple observations of the same phenomena at the same place and time.

**Table 31.1.**

Organisation Unit	Data Element	Period	Value
Gerehun CHC	Measles doses given	Dec-09	22
Tugbebu CHP	Measles doses given	Dec-09	18

## 31.2. Data elements: The What dimension

### 31.2.1. Data element categories

The data element mentioned above , "Measles doses given", can be further disaggregated into by combinations of data element categories. Each system administrator of DHIS2 is free to define any data element category dimensions for data elements. There are however, certain best practices which should generally be followed.

Given the example of Measles vaccination, if you want to know whether these vaccines were given at the facility (fixed) or out in the community as part of the outreach services then you could add a dimension called e.g. "Place of service" with the two possible options "Fixed" and "Outreach". Then all data collected on measles immunisation would have to be disaggregated along these two options. In addition to this you might be interested in knowing how many of these children who were under 1 year or above 1 year of age. If so you can add an Age dimension to the data element with the two possible options "<1 y" and ">1 y". This implies further detail on the data collection process. You can also apply both categories "Place of service" and "Age" and combine these into a data element category combination e.g. called "EPI disaggregation". You would then be able to look at four different more detailed values instead of only one as in the example above for the data element "Measles doses given": 1) "Fixed and <1 y, 2) Fixed and >1 y, 3) Outreach and <1 y, and 4) Outreach and >1 y. This adds complexity to how data is collected by the health facilities, but at the same time opens up for new possibilities of detailed data analysis of Measles immunisation.

**Table 31.2. Example of detailed storage of data values when using data element categories "Place of Service" and "Age" (simplified for readability compared to the actual database table)**

Organisation Unit	Data Element	Place of service	Age	Period	Value
Gerehun CHC	Measles doses given	Fixed	<1 y	Dec-09	12
Gerehun CHC	Measles doses given	Outreach	<1 y	Dec-09	4
Gerehun CHC	Measles doses given	Fixed	>1 y	Dec-09	4
Gerehun CHC	Measles doses given	Outreach	>1 y	Dec-09	2
Tugbebu CHP	Measles doses given	Fixed	<1 y	Dec-09	10

Organisation Unit	Data Element	Place of service	Age	Period	Value
Tugbebu CHP	Measles doses given	Outreach	<1 y	Dec-09	4
Tugbebu CHP	Measles doses given	Fixed	>1 y	Dec-09	3
Tugbebu CHP	Measles doses given	Outreach	>1 y	Dec-09	1

### 31.2.2. Data element group sets

While the data element categories and their options described above provide the level of detail (disaggregation) at the point of data collection and how data values get stored in the database, the data element group sets and groups can be used to add more information to data elements after data collection. As an example, if you are analyzing many data elements at the same time in a report, you would want to group these based on some criteria. Instead of looking at all the data captured in a form for immunisation and nutrition, you might want to separate or group data elements along a programme dimension (known as a data element group set in DHIS2) where "Immunisation" (or EPI) and "Nutrition" would be the two groups.

Expanding the report to include data from other programs or larger themes of health data would mean more groups to such a group set dimension, like "Malaria", "Reproductive Health", "Stocks". For this example, you would create a data element group set called "Programme" (or whatever name you find appropriate), and to represent the different programmes in this dimension you would define data elements groups called "EPI", "Nutrition", "Malaria", "Reproductive health" and so on, and add all these groups to the "Programme" group set. To link or tag the data element "Measles doses given" to such a dimension you must (in our example) add it to the "EPI" group. Which groups you add "Measles doses given" to does not affect how health facilities collect the data, but adds more possibilities to your data analysis. So for the group set dimensions there are three levels; the group set (e.g. "Programme"), the group (e.g. "EPI"), and the data element (e.g. "Measles doses given").

Indicators can be grouped into indicator groups and further into indicator group sets (dimensions) in exactly the same way as data elements.

**Table 31.3.**

Organisation Unit	Data Element	Programme	Period	Value
Gerehun CHC	Measles doses given	EPI	Dec-09	22
Gerehun CHC	Vitamin A given	Nutrition	Dec-09	16
Tugbebu CHP	Measles doses given	EPI	Dec-09	18
Tugbebu CHP	Vitamin A given	Nutrition	Dec-09	12
Gerehun CHC	Malaria new cases	Malaria	Dec-09	32
Tugbebu CHP	Malaria new cases	Malaria	Dec-09	23

### 31.3. The organisation unit dimension

Organisation units in DHIS2 should typically represent a location, such as a Community Health Centre or referral hospitals, or an administrative unit like "MoHS Sierra Leone", "Bo District" or "Baoma Chiefdom". In non-health sector applications, they could be "schools" or "water points". Orgunits are represented in a default hierarchy, usually the default administrative hierarchy of a country or region, and are therefore assigned an organisational level. As an example, Sierra Leone has four organisation unit levels; National, District, Chiefdom, and PHU, and all orgunits are linked to one of these levels. An orgunit hierarchy in DHIS2 can have any number of levels. Normally data is collected at the lowest level, at the health facility, but can be collected at any level within the hierarchy, such as both the districts as well as the facility level.

When designing reports at higher levels with data aggregated at the district or province level, DHIS2 will use the hierarchy structure to aggregate all the health facilities' data for any given unit at any level. The organisation unit level capturing the data always represents the lowest level of detail that is possible to use in data analysis, and the organisational levels define the available levels of aggregation along a geographical dimension.

#### 31.3.1. Organisation unit group sets and groups

While facility level is typically the lowest geographical level for disaggregation in DHIS2, there are ways to flexibly group organisation units into any number of dimensions by using the organisation unit groups and group set functionality. As an example, if all facilities are given an official type like "Community health center" or "District Hospital", it is possible to create an organisation unit group set called "Type" and add groups with the names of the types mentioned above. In order for the group sets to function properly in analysis, each organisation unit should be a member of a single group (compulsory and exclusive) within a group set. Stated somewhat differently, a facility should not be both a "Community health center" as well as a "District hospital".

##### 31.3.1.1. Inherit the values of an organisation unit group set

You can improve the completeness of your aggregated data by inheriting the settings of a "parent" organisation unit in your organisation unit hierarchy. This is particularly helpful if you are aggregating the data of more than 100 organisation units. See the [Maintenance](#) app documentation for more details.

##### 31.3.1.2. Alternative organisation unit hierarchies - advanced use of group sets and groups

A more advanced use of organisation unit group sets is to create alternative hierarchies e.g. use administrative borders from other ministries. In Sierra Leone that could mean an alternative hierarchy of 1:MoHS, 2:Districts, and 3: Local councils, instead of the four-level hierarchy with chiefdoms and PHUs. For instance, if all PHUs are linked to a specific local council, it would be possible to look at data aggregated by local council instead of chiefdom. Then you would first need to create a group set called "Local council" and then create one organisation unit group for every local council, and finally link all PHUs to their corresponding local council group.

**Table 31.4.**

District	OrgUnit Type	Data Element	Period	Value
Bo	CHC	Measles doses given	Dec-09	121
Bo	CHP	Measles doses given	Dec-09	98
Bo	MCHP	Measles doses given	Dec-09	87

District	OrgUnit Type	Data Element	Period	Value
Bombali	CHC	Measles doses given	Dec-09	110
Bombali	CHP	Measles doses given	Dec-09	67
Bombali	MCHP	Measles doses given	Dec-09	59

### 31.3.2. Best practice on the use of group sets and groups

As mentioned above, all organisation units should be a member of a single group within a group set. If an organisation unit is not present in any group or is present in multiple group members in a group set, this can lead to unexpected results in the analysis modules. DHIS2 has integrity checks to identify organisation units which are not present in any organisation unit group set member, or which is present in multiple groups.

## 31.4. The period dimension in DHIS2

The period dimension becomes an important factor when analysing data over time e.g. when looking at cumulative data, when creating quarterly or annual aggregated reports, or when doing analysis that combines data with different characteristics like monthly routine data, annual census/population data or six-monthly staff data.

### 31.4.1. Period types

In DHIS2, periods are organised according to a set of fixed period types described below. The following list is for the default ISO 8601 calendar type.

1. Daily
2. Weekly: The system supports various weekly period types, with Monday, Wednesday, Thursday, Saturday and Sunday as the first day of the week. You collect data through data sets configured to use the desired weekly period type. The analytics engine will attribute weekly data to the month which contains four days or more of the week.
3. Monthly: Refers to standard calendar months.
4. BiMonthly: Two-month periods beginning in January.
5. Quarterly: Standard ISO quarters, beginning in January.
6. SixMonthly: Six-month periods beginning in January
7. Yearly: This refers to a calendar year.
8. Financial April: Financial year period beginning on April 1st and ending on March 31st of the calendar next year
9. Financial July: Financial year period beginning on July 1st and ending on June 31st of the calendar next year
10. Financial Oct: Financial year period beginning on October 1st and ending on September 31st of the calendar next year
11. Six-monthly April: Six-month periods beginning on April 1st with a duration of six calendar months.

As a general rule, all organisation units should collect the same data using the same frequency or periodicity. A data entry form therefore is associated with a single period type to make sure data is always collected according to the correct and same periodicity across the country.

It is possible however to collect the same data elements using different period types by assigning the same data elements to multiple data sets with different period types, however

then it becomes crucial to make sure no organisation unit is collecting data using both data sets/period types as that would create overlap and duplication of data values. If configured correctly the aggregation service in DHIS2 will aggregate the data together, e.g. the monthly data from one part of the country with quarterly data from another part of the country into a national quarterly report. For simplicity and to avoid data duplication it is advised to use the same period type for all organisation units for the same data elements when possible.

### 31.4.2. Relative periods

In addition to the fixed period types described in the previous section, DHIS2 also support relative periods for use in the analysis modules.

When creating analytical resources within DHIS2 it is possible to make use of the relative periods functionality. The simplest scenario is when you want to design a monthly report that can be reused every month without having to make changes to the report template to accommodate for the changes in period. The relative period called "Last month" allows for this, and the user can at the time of report generation through a report parameter select the month to use in the report.

A slightly more advanced use case is when you want to make a monthly summary report for immunisation and want to look at the data from the current (reporting) month together with a cumulative value for the year so far. The relative period called "This year" provides such a cumulative value relative to the reporting month selecting when running the report. Other relative periods are the last 3,6, or 12 months periods which are cumulative values calculated back from the selected reporting month. If you want to create a report with data aggregated by quarters (the ones that have passed so far in the year) you can select "Last four quarters". Other relative periods are described under the reporting table section of the manual.

**Table 31.5.**

Organisation Unit	Data Element	Reporting month	So far this year	Reporting month name
Gerehun CHC	Measles doses given	15	167	Oct-09
Tugbebu CHP	Measles doses given	17	155	Oct-09

### 31.4.3. Aggregation of periods

While data needs to be collected on a given frequency to standardise data collection and management, this does not put limitations on the period types that can be used in data analysis and reports. Just like data gets aggregated up the organisational hierarchy, data is also aggregated according to a period hierarchy, so you can create quarterly and annual reports based on data that is being collected on a Monthly basis. The defined period type for a data entry form (data set) defines the lowest level of period detail possible in a report.

#### 31.4.3.1. Sum and average aggregation along the period dimension

When aggregating data on the period dimension there are two options for how the calculation is done, namely sum or average. This option is specified on a per data element in DHIS2 through the use of the 'aggregation operator' attribute in the Add/Edit Data Elements dialog.

Most of the data collected on a routinely basis should be aggregated by summing up the months or weeks, for instance to create a quarterly report on Measles immunisation one would sum up the three monthly values for "Measles doses given".

Other types of data that are more permanently valid over time like "Number of staff in the PHU" or an annual population estimate of "Population under 1 year" need to be aggregated

differently. These values are static for all months as long as there are valid data. For example, the "Estimated population under 1", calculated from the census data ,is the same for all months of a given year, or the number of nurses working in a given facility is the same for every month in the 6 months period the number is reported for.

This difference becomes important when calculating an annual value for the indicator morbidity service burden for a facility. The monthly head-counts are summed up for the 12 months to get the annual headcount, while the number of staff for the PHU is calculated as the average of the two 6-monthly values reported through the 6-monthly staff report. So in this example the data element "OPD headcount" would have the aggregation operator "SUM" and the data element "Number of staff" would have it set to "AVERAGE".

Another important feature of average data elements is the validity period concept. Average data values are standing values for any period type within the borders of the period they are registered for. For example, an annual population estimate following the calendar year, will have the same value for any period that falls within that year no matter what the period type. If the population under 1 for a given facility is 250 for the year of 2015 that means that the value will be 250 for Jan-15, for Q3-15, for Week 12 of 2015 and for any period within 2015. This has implications for how coverage indicators are calculated, as the full annual population will be used as denominator value even when doing monthly reports. If you want to look at an estimated annual coverage value for a given month, then you will have the option of setting the indicator to "Annualised" which means that a monthly coverage value will be multiplied by a factor of 12, a quarterly value by 4, in order to generate an effective yearly total. The annualised indicator feature can therefore be used to mimic the use of monthly population estimates.

## 31.5. Data collection vs. data analysis

### 31.5.1. Data collection and storage

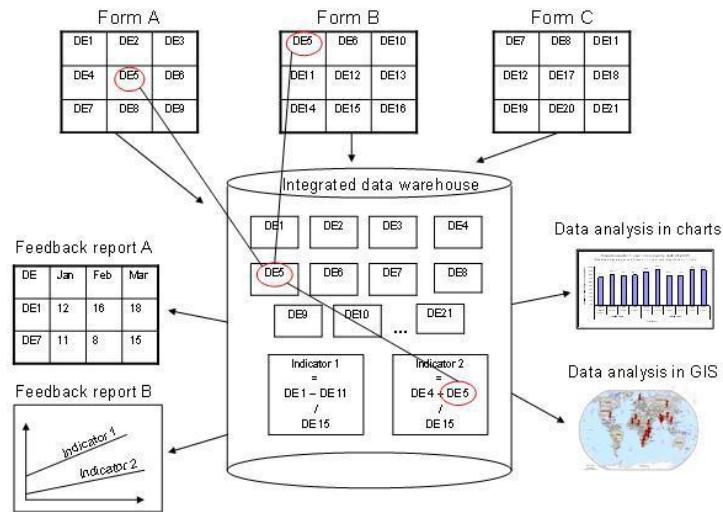

Datasets determine what raw data that is available in the system, as they describe how data is collected in terms of periodicity as well as spatial extent. Data sets define the building blocks of the data to be captured and stored in DHIS2. For each data dimension we decide what level of detail the data should be collected at namely 1) the data element (e.g. diagnosis, vaccine, or any event taking place) and its categories (e.g. age and gender), 2) the period/frequency dimension, and 3) the organisation unit dimension. For any report or data analysis you can never retrieve more detailed data than what is defined in the data sets, so the design of the datasets and their corresponding data entry forms (the data collection tools) dictate what kind of data analysis will be possible.

### 31.5.2. Input does not equal Output

It is important to understand that the data entry forms or datasets themselves are not intrinsically linked to the underlying data value and that the meaning of data is only described by the data element (and its categories). This makes it perfectly safe to modify datasets and forms without altering the data (as long as the data elements stay the same). This loose coupling between forms and data makes DHIS2 flexible when it comes to designing and changing new forms and in providing exactly the form the users want.

Another benefit of only linking data to data elements and not to forms, is the flexibility of creating indicators and validation rules based on data elements, and also in providing any kind of output report (in pivot tables, charts, maps etc) that can combine data individually or across forms, e.g. to correlate data from different health programs. Due to this flexibility of enabling integration of data from various programs (forms) and sources (routine and semi permanent (population, staff, equipment)) a DHIS2 database is used as an integrated data repository

for many or all parts of the aggregated data in a larger HIS. The figure below illustrates this flexibility.

In this example, we see that data elements from multiple forms can be combined to create a given indicator. As a more concrete example, one might collect "Population under one year of age" in an annual data set by district, and then collect a data element like "Fully immunized children" by month at the facility level. By annualizing the population, we can generate an approximation of the effective monthly population, and combining this with the aggregate total of the number of fully immunized children by month, it would be possible to generate an indicator "Fully immunized coverage", consisting of the aggregated total of children who are fully immunized, divided by the effective monthly population.

## 31.6. Extended examples of data elements and forms

The table below combines data element the two group sets Diagnosis (all the diseases) and Morbidity/Mortality (New cases, Follow-ups, Referrals, Deaths) with the data element category PHU/Community. Deaths are captured in a separate form with other dimensions (e.g. the PHU/Community) than morbidity.

Diagnosis	New cases	Follow-up	Referrals	Deaths		Total
				PHU	Community	
Malaria	19	9			1	29
Anaemia	1	1	4		23	29
All Others	1	1	6	5	5	18
Diarrhoea With Blood (Dysentery)	13				1	14
Yellow Fever	3	3		7		13
Wounds/Trauma				11		11
Tetanus					11	11
Lassa Fever				11		11
Measles		1	5	2		8
Etc. etc.						

This output table combines the two data element categories HIV\_Age and Gender with the data element group set ART Group. The group enables subtotals for staging and entry points

summing up the data elements in that group. Subtotals for either age groups and gender would be other possible columns to easily include here.

## DHIS2 Login screen

ART enrollment		Female			Male			Tot		
ART Group	Data Element	<15y	15-24y	25-49y	>49 y	<15	15-24	25-49	>49

	ART entry point: Other	1	11	1	1	1	1	5	11	32
	ART entry point: Transfer in	11	1	3	1	1	11	4	1	33
	ART entry point: Walk in	1	3	15	3	2	1	7	3	35
	ART entry point: PMTCT	1	1	1	1	1	1	1	1	8
	ART entry point: transfer out	1	1	1	1	11	1	1	1	18
<b>ART entry points total</b>		16	27	31	8	17	16	33	19	167

## 31.7. How this works in pivot tables

When doing data analysis in Excel pivot tables or any other OLAP based tool the dimensions become extremely powerful in providing many different views into the data. Each data element category or group set become a pivot field, and the options or groups become values within each of these fields. In fact categories and groupsets are treated exactly the same way in pivot tables, and so are orgunits, periods, and data elements. All these become dimensions to the data value that can be used to rearrange, pivot, filter, and to drill down into the data. Here we will show some examples of how the data dimensions are used in pivot tables.

Using the example of morbidity and mortality data, a pivot table can show how the dimensions can be used to view data for different aggregation levels.

The completely aggregated number is viewed when none of the pivot fields are arranged in the table area, as column or row fields, but are listed above the table itself as page field (filter).

Country	(All)
District	(All)
Chiefdom	(All)
year	(All)
month	(All)
referrals_age	(All)
mortality_age	(All)
oucommunity	(All)
morbidity_age	(All)
dataelement	(All)
MorbidityMortalityGroups	(All)
diagnosis	(All)
Sum of value	
main_de_groups	Total
	2084600

Here we have selected to look at the Morbidity total. The various data elements on morbidity have been ordered into the main\_de\_groups Morbidity (we will get back to Mortality later). The fields above the table itself are all set to "All", meaning that the totals in the table will contain data from all Countries, Districts, Chiefdom, ou\_type, year, months, the various categories as listed in the red fields, and all data elements in the Morbidity group.

As we have seen, this is not a very useful representation, as Morbidity is organized into new cases, follow-ups, referrals, and then again in age groups. Also, we do not see the various diagnoses. The first step is to include the diagnoses field (which is a group set), which is done by dragging the "diagnosis" field down to be a row field, as shown in the figure below, and to add the group set called "morbiditymortality" in the column field to display new cases, follow-up, and referrals.

They both show the same data (some of the rows have been cut in the screenshot due to image size), albeit in a different way.

- The "dataelement" field, used in the bottom figure, displays each diagnosis as three elements; one follow-up, one new, and one referrals. This is the way the data elements have been defined in DHIS, as this makes sense for aggregation. You would not like to aggregate follow-ups and new, thus these have not been made as categories, the whole point of is to ease aggregation and disaggregation.
- The "diagnosis" group set has instead been made to lump these three (follow-up, new, referrals) together, which can then be split with another group set, namely the one called "morbiditymortality". This allows us to organize the data as in the first of the two figures, where we have the single diagnosis per row, and the groups new, follow-up, referrals as rows.

The idea of using group sets is that you can combine, in any set, different data elements. Thus, if we add the mortality data (by checking it from the drop-down menu of the main\_de\_groups field, and moving this field out of the table) we can see also the deaths, since the mortality data elements have been included as a "death" group in the "morbiditymortality" group set. The result is shown below.

Diarrhoea Without Severe Dehydration	4	4		
Eye Infection	4	4	2	

The result is a much more user-friendly pivot table. Now, another figure shows the relationship between the group sets and elements (these are fake data values).

This small detail of the pivot table show how the actual data elements link to the group sets:

- The four data elements, as defined in DHIS, are Measles death, Measles follow-up, Measles new, and Measles referrals
- They all belong to the group set "diagnosis", where they have been lumped together in the group Measles
- The group set "morbiditymortality" contains the groups New cases, Follow-up, Referrals, and Deaths.
- Only the data element Measles deaths has data related to the group Deaths, thus this is where the data value (20) is shown, at the upper right corner. The same for Measles new; the value (224) is shown at the intersection of the data element Measles new and the group New cases (in the group set morbiditymortality)
- All the intersections where the data element does not link with the groups in morbiditymortality are left blank. Thus in this case we would get a nice table if we excluded the dataelement from the table, and just had diagnosis and the group set morbiditymortality, as in the figure shown earlier

Now lets see how the data element categories can be used. In the data entry form for Morbidity the new cases and follow-ups use one age category, the referral data another,, and the mortality data a third age breakup, so these are available as three individual age group fields in the pivot tables called morbidity\_age, referrals\_age and mortality\_age. It doesn't make sense to use these while looking at these data together (as in the examples above), but e.g. if we only want to look at the only the new cases we can put the MorbidityMortalityGroups field back up as a page field and there select the New cases group as a filter. Then we can drag the Morbidity\_age field down to the column area and we get the following view:

The following table illustrates the benefits of reusing data element categories across datasets and category combinations. The VCCT, ART and PMTCT data are collected in three different datasets, the first two with both gender and age breakdown, and the PMTCT only age (gender is given). All three share the same age groups and therefore it is possible to view data elements from all these three datasets in the same table and use the age dimension. In the previous example with morbidity and mortality data this was not possible since new cases, referrals and deaths all have different age groups.

## 31.8. Case study: From paper forms to multidimensional datasets - lessons learned

Typically the design of a DHIS2 dataset is based on some requirements from a paper form that is already in use. The logic of paper forms are not the same as the data element and data set model of DHIS, e.g. often a field in a tabular paper form is described both by column headings and text on each row, and sometimes also with some introductory table heading that provides more context. In the database this is captured in one atomic data element with no reference to a position in a visual table format, so it is important to make sure the data element with the optional data element categories capture the full meaning of each individual field in the paper form.

Another important thing to have in mind while designing datasets is that the dataset and the corresponding data entry form (which is a dataset with layout) is a data collection tool and not a report or analysis tool. There are other far more sophisticated tools for data output and reporting in DHIS2 than the data entry forms. Paper forms are often designed with both data collection and reporting in mind and therefore you might see things such as cumulative values (in addition to the monthly values), repetition of annual data (the same population data reported every month) or even indicator values such as coverage rates in the same form as the monthly raw data. When you store the raw data in DHIS2 every month and have all the processing power you need within the computerised tool there is no need (in fact it would be stupid and most likely cause inconsistency) to register manually calculated values such as the ones mentioned above. You only want to capture the raw data in your datasets/forms and leave the calculations to the computer, and presentation of such values to the reporting tools in DHIS.

### 31.8.1. From tables to category combinations - designing multi-dimensional data sets

As we have seen in the examples above, data element categories and category options are helpful in representing tabular data, when adding dimensions to a field in a paper form. We have also seen how the data element is one of the required dimensions which describe data in DHIS2. As we will see in the example below there are often more than one way to represent a paper form in DHIS2 , and it can be difficult to know which dimension to represent with a data element name and which to represent as categories, or even as groups as we have seen above. Here are some general lessons learned from working with data element and category combinations:

- Design your dimensions with data use in mind, not data collection. This means that disaggregation of data values at collection time should be easily aggregated up along the various dimensions, as in adding up to a meaningful total.

- Reuse dimensions as much as possible as this increases the ability to compare disaggregated data (e.g. age groups, fixed/outreach, gender).
- Disaggregation dimensions should add up to a total. In certain cases, data elements may be collected as subsets of each other. In this case, use of categories to disaggregate the data element should not be used. As an example, we might collect "Number of confirmed malaria cases" and disaggregate this by "Under 5" and "Over 5". A third data element "Number of confirmed malaria cases under 1" might also exist on the form. It would seem reasonable then to create three age groups : Under 1, Under 5 and Over 5, to describe the disaggregation. However, the Under 1 is actually a subset of the Under 5 group, and when totaled, would result in duplication. Thus, categories should be generally be composed of mutually exclusive category options, such that the sum of individual category options results in a coherent total.
- Different levels of dimensions; 1) disaggregation and 2) grouping. Disaggregation dimensions dictate how you collect and how detailed you store your data, so plan these carefully. The group dimension is more flexible and can be changed and added to even after data collection (think of it as tagging).
- It is best to think of how the data would be used in an integrated data repository and not how it will actually be collected on forms or by programs when designing the meta-data model. Ideally, the same type of disaggregation should be used across forms and datasets for data elements which will be analysed together, or used to build indicators. Reuse definitions so that the database can integrate even though the forms themselves might be duplicated (which in practice, is often the case).

In order to better explain the approach and the possibilities we present an example paper form and will walk through it step by step and design data elements, categories, category options and category combinations.

This form has many tables and each of them potentially represent a data element category combination (from now on referred to as a catcombo). As such there is no restriction on a dataset to only have one set of dimensions or catcombo, it can have many and as we see above this is necessary as the dimensions are very different from table to table. In the following paragraphs, we will analyze how to break down this form into its component pieces and suggest an implementation pathway in DHIS2.

**ANC table.** This table in the top left corner is one the simpler ones in this form. It has two dimensions, the first column with the ANC activity or service (1st visit, IPT 2nd dose etc) and the second and third column which represent the place where the service was given with the two options "Fixed" and "Outreach". Since the ANC service is the key phenomena to analyse here, and often there is a need for looking at the total of "ANC 1st visits" no matter where they actually took place, it makes a lot of sense to use this dimension as the data element dimension.

Thus, all items on the first column from "1st ANC" visit to "2nd IPT dose given by TBA" are represented as individual data elements. The "where" dimension is represented as a data element category (from now on referred to as category) with the name "fixed/outreach" with the two data element category options (from now on catoptions) "fixed" and "outreach". There is no other dimension here so we add a new catcombo with the name "Fixed/Outreach" with one category "Fixed/Outreach". Strictly speaking there is another dimension in this table, and that is the at PHU or by TBA dimension which is repeated for the two doses of IPT, but since none of the other ANC services listed have this dimension it does not seem like a good idea to separate out two data elements from this table and give them another catcombo with both fixed/outreach and at PHU/by TBA. reusing the same catcombo for all the ANC services makes more sense since it will be easier to look at these together in reports etc. and also the fact that there is not much to lose by repeating the at PHU or by TBA information as part of the data element name when it is only for four data elements in a table of eleven data elements.

**DELIVERY table.** This table is more tricky as it has a lot of information and you can see that not all the rows have the same columns (some columns are merged and a one field is grayed out/disabled.). If we start by looking at the first column "Deliveries assisted by" that seems to be one dimension, but only down to the "Untrained TBA" row, as the remaining three rows are not related to who assisted the delivery at all. Another dimension is the place of delivery, either In PHU or in Community as stated on the top column headings. These deliveries are further split into the outcome of the delivery, whether it is a live or still birth, which seems to be another dimension. So if we disregard the three bottom rows for a moment there seems to be 3 dimensions here, 1) assisted by, 2) place of delivery, and 3) delivery outcome. The key decision to make is what to use as the data element, the main dimension, the total that you will most often use and want easily available in reports and data analysis.

In this case, the outcome dimension as "Total live births" is a very commonly used value in many indicators (maternal mortality ratio, births attended by skilled health personnel etc.). In this case the "Assisted By" dimension could also have been used without any problem, but the added value of easily getting the total live births information was the decisive point for us. This means that from this table (or sub-table of row 1 to 6) there are only two data elements; "Live births" and "Still births".

Next, there are two more dimensions, the "PHU/Community" with its two options and a "Births attended by" with options ("MCH Aides", "SECHN", "Midwives", "CHO", "Trained TBA", "Untrained TBA"). These two categories make up the catcombo "Births" which is assigned to the two data elements "Live births" and "Still births". Considering the final three rows of the delivery table we can see that "Complicated Deliveries" does not have the assisted by dimension, but has the place and the outcome. "Low birth weight" also does not have the assisted by dimension and not the outcome either. The LLITN given after delivery does not have any additional dimension at all. Since not any of the three rows can share catcombo with any other row we decided to represent these fields as so called flat data elements, meaning data elements with no categories at all, and simply adding the additional information from the column headings to the data element name, and therefore ended up with the following data

elements with the default (same as none) catcombo; "Complicated deliveries in PHU live birth", "Complicated deliveries in PHU still births", "Complicated deliveries in community live birth", "Complicated deliveries in community still births", "Low birth weight in PHU", "Low birth weight in community", and "LLITN given after delivery".

**POST-NATAL CARE table** This table is simple and we used the same approach as for the ANC table. 3 data elements listed in the first column and then link these to the catcombo called "fixed/outreach". Reusing the same category fixed/outreach for these data elements enables analysis on fixed/outreach together with ANC data and other data using the same category.

**TT table** This table is somewhat more complex than the previous examples. We decided to use "TT1", "TT2" ... "TT5" as data elements which makes it easy to get the total of each one of these. There is fixed/outreach dimension here, but there is also the "In school place" that is only applied to the Non-Pregnant, or more correctly to any of the two as the school immunisation is done whether the girls are pregnant or not. We consulted the program people behind the form and found out that it would be OK to register all school TT immunisations as non-pregnant, which simplifies the model a bit since we can reuse the "TT1" to "TT5" data elements. So we ended up with a new category called "TT place" with the three options (Fixed, Outreach, In School), and another category called "Pregnant/Non-pregnant" with two options. The new catcombo "TT" is then a combination of these two and applied to the 5 TT data elements. Since we agreed to put all In Schools immunisations under Non-pregnant in means that the combination of options (Pregnant+In School) will never be used in any data entry form, and hence become a possible optioncombo, which is OK. As long as the form is custom designed then you can choose which combinations of options to use or not, and therefore it is not a problem to have such passive or unused catoptions. Having school as one option in the TT place category simplifies the model and therefore we thought it was worth it. The alternative would be to create 5 more data elements for "TT1 in school" ... "TT5 in school", but then it would be a bit confusing to add these together with the "TT1" ..."TT5" plus TT catcombo. Having school as a place in the TT place category makes it a lot easier to get the total of TT1.. TT5 vaccines given, which are the most important numbers and most often used values for data analysis.

**Complications of early and late pregnancy and labour tables** We treat these two tables as one, and will explain why. These two tables are a bit confusing and not the best design. The most important data coming out of these tables are the pregnancy complications and the maternal deaths. These data elements contain further detail on the cause of the complication or death (the first column in both tables), as well as a place of death (in PHU or community), and an outcome of the complication (when its not a death) that can be either "Managed at PHU" or "Referred". We decided to create two data elements for these two tables; "Pregnancy complications", and "Maternal Deaths", and two category combinations, one for each of the data elements. For the Pregnancy Complications data element there are two additional dimensions, the cause of the complication (the combined list of the first column in the two tables) and the outcome (managed at PHU or Referred), so these are the categories and options that make up that category combination. For the "Maternal deaths" data element the same category with the different causes are used and then another category for the place of death (in PHU or In community). This way the two data elements can share one category and it will be easy to derive the total number of pregnancy complications and maternal deaths. While the list of complications on the paper form is divided into two (early and late/labour) you can see that e.g. the malaria in 2nd and 3rd trimester are listed under early, but in fact are for a later phase of the pregnancy. There is no clear divide between early and late complications in the form, and therefore we gave up trying to make this distinction in the database.

**Family Planning Services table** This table has 2 dimensions, the family planning method (contraceptive) and whether the client is new or continuing. We ended up with one data element only "Family planning clients" and then added two categories "FP method" with all the contraceptives as options, and another category "FP client type" with new or continuing as options. This way it will be easy to get the total number of family planning clients which is the major value to look at in data analysis, and from there you can easily get the details on method or how many new clients there are.

### 31.8.2. Step-by-step approach to designing datasets

1. Identify the different tables (or sub datasets) in the paper form that share the same dimensions
2. For each table identify the dimensions that describe the data fields
3. Identify the key dimension, the one that makes most sense to look at in isolation (when the others are collapsed, summed up). This is your data element dimension, the starting point and core of your multidimensional model (sub dataset). The data element dimension can be a merger of two or more dimensions if that makes more sense for data analysis. The key is to identify which total that makes most sense to look at alone when the other dimensions are collapsed.
4. For all other/additional dimensions identify their options, and come up with explanatory names for dimensions and their options.
5. Each of these additional dimensions will be a data element category and their options will be category options.
6. Combine all categories for each sub dataset into one category combination and assign this to all the data elements in your table (or sub dataset if you like).
7. When you are done with all the tables (sub datasets), create a new dataset and add all the data elements you have identified (in the whole paper form) to that dataset.
8. Your dataset will then consist of a set of data elements that are linked to one or more category combinations.

# Chapter 32. DHIS2 Frequently Asked Questions

**32.1.** I have entered data into a data entry form, but I cannot see the data in any reports (pivot tables, charts, maps). Why does data which is entered not show up immediately in my graphs in DHIS2?

Data which is entered into DHIS2 must first be processed with the "analytics". This means that data is not immediately available in the analytics resources (such as reports, pivot tables, data visualizer, GIS, etc) after it has been entered. If scheduling is active, the analytics process will run automatically at midnight each day. After that, new data which was entered since the last time the analytics process ran, will become visible.

You can trigger the analytics process manually by selecting Reports->Analytics from the main menu and pressing the "Start export" button. Note, the process may take a significant amount of time depending on the amount of data in your database.

Other factors which can affect the visibility of data are:

- Data approval: If data has not been approved to a level which corresponds to your users level, the data may not be visible to you.
- Sharing of meta-data objects: If certain meta-data objects have not been shared with a user group which you are a member of, the data may not be visible to you.
- Caching of analytics: In many cases, server administrators cache analytical objects (such as pivot tables, maps, graphs) on the server. If you have entered data, re-run analytics, and you are still not seeing any (updated) data, be sure that your data is not being cached by the server.

**32.2.** I have downloaded DHIS 2 from <https://www.dhis2.org/downloads> but when i try to enter the system it needs a username and password. Which should I use?

By default, the username will be "admin" and the password "district". Usernames and passwords are case sensitive.

# Chapter 33. Release and upgrade notes

**Table 33.1. DHIS2 releases**

Version	Release date	Release notes	Upgrade notes
<a href="#">2.26</a>	2017-02-01		
<a href="#">2.25</a>	2016-10-13		
<a href="#">2.24</a>	2016-07-04		
<a href="#">2.23</a>	2016-04-25		
<a href="#">2.22</a>	2016-01-15		
<a href="#">2.21</a>	2015-10-21		
<a href="#">2.20</a>	2015-07-20		
<a href="#">2.19</a>	2015-05-15		
<a href="#">2.18</a>	2015-01-22		
<a href="#">2.17</a>	2014-11-21		
<a href="#">2.16</a>	2014-07-25		
<a href="#">2.15</a>	2014-05-10		

# Appendix A. User authorities

**Table A.1.**

Accept data at lower levels	F_ACCEPT_DATA_LOWER_LEVELS
Access my data mart	F_MYDATAMART_VIEW
Add Facility	F_FRED_CREATE
Add Locale	F_LOCALE_ADD
Add Option Set	F_OPTIONSET_ADD

# Appendix B. System settings

## B.1. General settings

**Table B.1. General settings**

Setting	Description
<b>Maximum number of analytics records</b>	<p>Increase this number to provide more records from the analytics.</p> <p>The default value is 50,000.</p> <p> <b>Warning</b></p> <p>Use the setting <b>Unlimited</b> carefully, it might result in a very high load on your server.</p>
<b>Infrastructural indicators</b>	<p>Defines an indicator group where the member indicators should describe data about the organisation units' infrastructure.</p> <p>You can view the infrastructural data in the <b>GIS</b> app: right-click a facility and click <b>Show information</b>.</p>
<b>Infrastructural data elements</b>	<p>Defines a data element group where the member data elements should describe data about the organisation units' infrastructure.</p> <p><b>Example B.1.</b></p> <p>Infrastructural data elements can be population, doctors, beds, Internet connectivity and climate.</p> <p>You can view the infrastructural data in the <b>GIS</b> app: right-click a facility and click <b>Show information</b>.</p>
<b>Infrastructural period type</b>	<p>Sets the frequency for which the data elements in the infrastructural data elements group are captured.</p> <p>This will typically be yearly. When viewing the infrastructural data you will be able to select the time period of the data source.</p> <p>You can view the infrastructural data in the <b>GIS</b> app: right-click a facility and click <b>Show information</b>.</p>
<b>Default relative period for analysis</b>	TBA
<b>Feedback recipients</b>	Defines a user group where the members will receive all messages sent via the feedback function in the <b>Dashboard</b> app.

Setting	Description
	This will typically be members of the super user team who are able to support and answer questions coming from end-users.
<b>Max offline organisation unit levels</b>	<p>Defines how many levels in the organisation unit hierarchy will be available offline in the organisation unit tree widget.</p> <p>Under normal circumstances you can leave this on the lowest level, which is default is the default setting.</p> <p>It can be useful to set it to a higher level to reduce initial load time in cases where you have a large number of organisation units, typically more than 30 000.</p>
<b>Data analysis std dev factor</b>	<p>Sets the number of standard deviations used in the outlier analysis performed on the captured data in the <b>Data Entry</b> app.</p> <p>The default value is 2. A high value will catch less outlier values than a low value.</p>
<b>Phone number area code</b>	<p>The area code for the area in which your deployment is located.</p> <p>Used for sending and receiving SMS. Typically, this is a country code.</p> <p><b>Example B.2.</b></p> <p>+260 (country code for Zambia)</p>
<b>Enable multi-organisation unit forms</b>	<p>Enables support to enter data forms for multiple organisation units at the same time in the <b>Data Entry</b> app.</p> <p>If you've enabled this setting, you can in the <b>Data Entry</b> app, click on the parent organisation unit for the children that you want to enter data for, and the data set list will include data sets that are assigned to the children of that parent.</p>
<b>Days after period end to qualify for timely data submission</b>	<p>Sets the number of days after the end of a period in which a data entry form must be marked as complete in order to be considered timely.</p> <p>The setting affects the <b>Reporting rate summary</b> report you create in the <b>Reports</b> app. This report lists data entry forms marked as complete as well as data entry forms marked as completed on time.</p> <p>The default value is 15.</p>
<b>Omit indicator values with zero numerator value in data mart:</b>	Defines whether aggregated indicator values with zero as the numerator value should be written to the indicator data mart table.

Setting	Description
	<p>You must write such values for example when connecting Excel pivot tables to the data mart since Excel will need the numerator data to correctly aggregate up in the organisation unit hierarchy.</p> <p>If third-party tools are not used with DHIS2, this will reduce the total number of values written to the data mart (which again will improve performance) and could safely be set to omit.</p>

## B.2. Analytics settings

**Table B.2. Analytics settings**

Setting	Description
<b>Default relative period for analysis</b>	<p>Defines the relative period to use by default in analytics app: <b>Data Visualizer</b>, <b>Event Reports</b>, <b>Event Visualizer</b>, <b>GIS</b> and <b>Pivot Table</b> apps. The relative period will be automatically selected when you open these apps.</p> <p>Recommended setting: the most commonly used relative period among your users.</p>
<b>Cacheability</b>	<p>Sets whether analytics data responses should be served with public or private visibility.</p> <p><b>Private:</b> Any node or server between the DHIS2 server and the end user which has the ability to cache can NOT cache the web page. This is useful if the page served can or do contain sensitive information. This means that each time you want a web page, either you get a new page from the DHIS2 server, or the DHIS2 server caches the page. No other server than the DHIS2 server are allowed to cache the page.</p> <p><b>Public:</b> Any node or server between the DHIS2 server and the end user which has the ability to cache can cache the web page. This relives the traffic to the DHIS2 server and potentially speeds up the subsequent page loading speed.</p>
<b>Cache strategy</b>	<p>Decides for how long reports and responses related to analysis should be cached.</p> <p>If you use the scheduled, nightly analytics tables update, select <b>Cache until 6 AM tomorrow</b>. This is because data in reports change at that time, and you can safely</p>

Setting	Description
	cache data up to the moment when the analytics tables are updated.  If you are loading data continuously into the analytics tables, select <b>No cache</b> .
<b>Max number of years to hide unapproved data in analytics</b>	<p>Sets whether and for how long back in time the analytics engine should hide unapproved data.</p> <p><b>Never check approval:</b> no data will be hidden, irrespective of its data approval status.</p> <p><b>Check approval for all data:</b> approval status will always be checked.</p> <p>Other options, for example <b>Last 3 years:</b> approval status will be checked for data which is newer than 3 years old; older data will not be checked.</p>
<b>Threshold for analytics data caching</b>	<p>Sets whether to enable caching data older than the specified number of years only.</p> <p>This allows for returning the most recent data directly with no caching, while serving cached version of older data for performance concerns.</p>
<b>Respect category option start and end date in analytics table export</b>	<p>Sets whether aggregate data values where the data period falls outside the start and end date of the category options of the data attribute category option combination should be filtered out of the analytics tables when generated.</p>
<b>Put analytics in maintenance mode</b>	<p>Puts the analytics engine and web API resource in maintenance mode. This means that "503 Service Unavailable" will be returned for all requests.</p> <p>This is useful when you need to perform maintenance on the server, for example rebuilding indexes while the server is running in production, in order to reduce load and more efficiently carry out the maintenance.</p>

### B.3. Server settings

**Table B.3. Server settings**

Setting	Description
<b>Number of database server CPUs</b>	Sets the number of CPU cores of your database server.

Setting	Description
	This allows the system to perform optimally when the database is hosted on a different server than the application server, as the analytics engine scales linearly on the number of available cores.
<b>System notifications email address</b>	<p>Defines the email address which will receive system notifications.</p> <p>Notifications about failures in processes such as analytics table generation will be sent here. This is useful for application monitoring.</p>
<b>Server base URL</b>	<p>Defines the full, externally accessible base URL for your server.</p> <p>The URL is used to provide links to your server from external locations such as emails sent from the system.</p> <p> <b>Note</b></p> <p>If you don't specify a server base URL, emails sent from the DHIS2 messaging system will not contain a reply link.</p> <p><b>Example B.3.</b></p> <p><i>https://apps.dhis2.org/demo</i> is the server base URL for the DHIS2 demo server.</p>
<b>Google Analytics (Universal Analytics) key</b>	<p>Sets the Google UA key to provide analytics for your DHIS2 instance.</p> <p>Most places are covered, but it will not be provided for custom apps. You can read more about Google Analytics at <a href="http://google.com/analytics">http://google.com/analytics</a>.</p>

## B.4. Appearance settings

**Table B.4. Appearance settings**

Setting	Description
<b>Select language</b>	<p>Sets the language for which you can then enter translations of the following settings:</p> <ul style="list-style-type: none"> <li>• <b>Application introduction</b></li> <li>• <b>Application title</b></li> <li>• <b>Application notification</b></li> <li>• <b>Application left-side footer</b></li> <li>• <b>Application right-side footer</b></li> </ul>
<b>Application title</b>	Sets the application title on the top menu.

<b>Setting</b>	<b>Description</b>
<b>Application introduction</b>	Sets an introduction of the system which will be visible on the top-left part of the login page.
<b>Application notification</b>	Sets a notification which will be visible on the front page under the login area.
<b>Application left-side footer</b>	Sets a text in the left-side footer area of the login page.
<b>Application right-side footer</b>	Sets a text in the right-side footer area of the login page.
<b>Style</b>	<p>Sets the style (look-and-feel) of the system. The user can override this setting in the <b>Settings</b> app: <b>User settings &gt; Style</b>.</p> <p> <b>Note</b></p> <p>Due to technical reasons, it's not possible to change the color of the newest version of the header bar. The apps with the newest header bar will retain the blue header bar.</p>
<b>Start page</b>	<p>Sets the page or app which the user will be redirected to after log in. Recommended setting: the <b>Dashboard</b> app.</p>
<b>Help page link</b>	Defines the URL which users will see when they click <b>Profile &gt; Help</b> .
<b>Flag</b>	Sets the flag which is displayed in the left menu of the <b>Dashboard</b> app.
<b>Interface language</b>	<p>Sets the language used in the user interface. The user can override this setting in the <b>Settings</b> app: <b>User settings &gt; Interface language</b>.</p>
<b>Database language</b>	<p>Sets the language used in the database. The user can override this setting in the <b>Settings</b> app: <b>User settings &gt; Database language</b>.</p>
<b>Property to display in analysis modules</b>	<p>Sets whether you want to display the metadata objects' names or short names in the analytics apps: <b>Data Visualizer</b>, <b>Event Reports</b>, <b>Event Visualizer</b>, <b>GIS</b> and <b>Pivot Table</b> apps. The user can override this setting in the <b>Settings</b> app: <b>User settings &gt; Property to display in analysis modules</b>.</p>
<b>Default digit group separator to display in analysis modules</b>	Sets the default digit group separator in the analytics apps: <b>Data Visualizer</b> , <b>Event Reports</b> , <b>Event Visualizer</b> , <b>GIS</b> and <b>Pivot Table</b> apps.

Setting	Description
<b>Require authority to add to view object lists</b>	If you select this option, you'll hide menu and index page items and links to lists of objects if the current user doesn't have the authority to create the type of objects (privately or publicly).
<b>Custom login page logo</b>	Select this option and upload an image to add your logo to the login page.
<b>Custom top menu logo</b>	Select this option and upload an image to add your logo to the left in the top menu.

## B.5. Email settings

**Table B.5. Email settings**

Setting	Description
<b>Host name</b>	Sets the host name of the SMTP server.  <b>Example B.4.</b>  When you use Google SMTP services, the host name should be <i>smtp.gmail.com</i> .
<b>Port</b>	Sets the port to connect to the SMTP server.
<b>User name</b>	The user name of the user account with the SMTP server.  <b>Example B.5.</b>  mail@dhis2.org
<b>Password</b>	The password of the user account with the SMTP server.
<b>TLS</b>	Select this option if the SMPT server requires TLS for connections.
<b>Email sender</b>	The email address to use as sender when sending out emails.
<b>Send me a test email</b>	Sends out a test to email.

## B.6. Messaging settings

A message that something happened internally that you have to investigate.

- A general setting, if user doesn't have his/hers "own" notification settings.
- Used in internal DHIS2 messaging system: System message (generated by the system, can be many things, something has gone wrong), private message, ticket message, validation result message (result of validation analysis) (4 type of messages right now)
- Push analysis don't go through internal DHIS2 messaging system, always send via email
- Can also send despite all settings (force send)

**Table B.6. Messaging settings**

<b>Setting</b>	<b>Description</b>
<b>Enable message email notifications</b>	Defines whether DHIS 2 user messages should be delivered to the email address associated with the user by default. This setting can be overridden by user settings.
<b>Enable message SMS notifications</b>	Defines whether DHIS 2 user messages should be delivered as SMS to the mobile phone number associated with the user by default. This setting can be overridden by user settings.

## B.7. Access settings

**Table B.7. Access settings**

<b>Setting</b>	<b>Description</b>
<b>Self registration account user role</b>	<p>Defines which user role should be given to self-registered user accounts.</p> <p>To enable self-registration of users: select any user role from the list. A link to the self-registration form will be displayed on the login page.</p> <p> <b>Note</b></p> <p>To enable self-registration, you must also select a <b>Self registration account organisation unit</b>.</p> <p>To disable self-registration of users: select <b>Disable self registration</b>.</p>
<b>Self registration account organisation unit</b>	<p>Defines which organisation unit should be associated with self-registered users.</p> <p> <b>Note</b></p> <p>To enable self-registration, you must also select a <b>Self registration account user role</b>.</p>
<b>Do not require recaptcha for self registration</b>	Defines whether you want to use reCAPTCHA for user self-registration. This is enabled by default.
<b>Enable user account recovery</b>	<p>Defines whether users can restore their own passwords.</p> <p>When this setting is enabled, a link to the account recovery form will be displayed on the front page.</p>

Setting	Description
	 <b>Note</b> User account recovery requires that you have configured email settings (SMTP).
<b>Lock user account temporarily after multiple failed login attempts</b>	Defines whether the system should lock user accounts after five successive failed login attempts over a timespan of 15 minutes. The account will be locked for 15 minutes, then the user can attempt to log in again.
<b>Allow users to grant own user roles</b>	Defines whether users can grant user roles which they have themselves to others when creating new users.
<b>Allow assigning object to related objects during add or update</b>	Defines whether users should be allowed to assign an object to a related object when they create or edit metadata objects. <b>Example B.6.</b> You can allow users to assign an organisation unit to data sets and organisation unit group sets when creating or editing the organisation unit.
<b>Require user account password change</b>	Defines whether users should be forced to change their passwords every 3, 6 or 12 months. If you don't want to force users to change password, select <b>Never</b> .
<b>Minimum characters in password</b>	Defines the minimum number of characters users must have in their passwords. You can select 8 (default), 10, 12 or 14.
<b>OpenID provider</b>	Defines the OpenID provider.
<b>OpenID provider label</b>	Defines the label to display for the specified OpenID provider.
<b>CORS whitelist</b>	Whitelists a set of URLs which can access the DHIS 2 API from another domain. Each URL should be entered on separate lines. Cross-origin resource sharing (CORS) is a mechanism that allows restricted resources (e.g. javascript files) on a web page to be requested from another domain outside the domain from which the first resource was served.
<b>Mapzen search API key</b>	Defines the API key for the Mapzen API. This API is used to search addresses globally within DHIS 2.
<b>Google Maps API key</b>	Defines the API key for the Google Maps API. This is used to display maps within DHIS 2.

## B.8. Approval settings

### Note

For more information about how you configure data approvals, refer to [Data approval](#)

**Table B.8. Approval settings**

Setting	Description
Approval level	The levels at which you want to approve data in the system.
Approval workflow	The workflows that the system will use to approve data. Each workflow can be associated with one or more approval levels.
<b>Acceptance required before approval</b>	Defines whether to include an acceptance step before the approval step in the approval workflow.

## B.9. Calendar settings

**Table B.9. Calendar settings**

Setting	Description
<b>Calendar</b>	<p>Defines which calendar the system will use.</p> <p>The system supports the following calendars: Coptic, Ethiopian, Gregorian, Islamic, ISO 8601, Julian, Nepali and Thai.</p>
<b>Date format</b>	<p> This is a system wide setting. It is not possible to have multiple calendars within a single DHIS2 instance.</p> <p>Defines which date format the system will use.</p>

## B.10. Data import settings

The data import settings apply to the data import process. They provide optional constraints on what should be considered a conflict during import. The constraints are applied to each individual data value in the import.

**Table B.10. Data import settings**

Setting	Description
<b>Require periods to match period type of data set</b>	Require period of data value to be of the same period type as the data sets for which the data element of data value is assigned to.
<b>Require category option combos to match category combo of data element</b>	Require category option combination of data value to be part of the category combination of the data element of the data value.

Setting	Description
<b>Require organisation units to match assignment of data set</b>	Require organisation unit of data value to be assigned to one or more of the data sets which the data element of data value is assigned to.
<b>Require attribute option combos to match category combo of data set</b>	Require attribute option combination of data value to be part of the category combination of the data set which the data element of data value is assigned to.
<b>Require category option combo to be specified</b>	Require category option combination of data value to be specified. By default it will fall back to default category option combination if not specified.
<b>Require attribute option combo to be specified</b>	Require attribute option combination of data value to be specified. By default it will fall back to default attribute option combination if not specified.

## B.11. Synchronization settings

The following settings are used for both data and metadata synchronization.

### Note

For more information about how you configure metadata synchronization, refer to [Configure metadata synchronizing](#)

**Table B.11. Synchronization settings**

Setting	Description
<b>Remote server URL</b>	<p>Defines the URL of the remote server running DHIS2 to upload data values to.</p> <p>It is recommended to use of SSL/HTTPS since user name and password are sent with the request (using basic authentication).</p> <p>The system will attempt to synchronize data once every minute.</p> <p>The system will use this setting for metadata synchronization too.</p> <p> <b>Note</b></p> <p>To enable data and metadata synchronization, you must also enable <b>Data synchronization</b> and <b>Metadata synchronization</b> in the <b>Data administration</b> app &gt; <b>Scheduling</b>.</p>

Setting	Description
<b>Remote server user name</b>	<p>The user name of the DHIS2 user account on the remote server to use for data synchronization.</p> <p> <b>Note</b></p> <p>If you've enabled metadata versioning, you must make sure that the configured user has the authority "F_METADATA_MANAGE".</p>
<b>Remote server password</b>	<p>The password of the DHIS2 user account on the remote server. The password will be stored encrypted.</p>
<b>Enable versioning for metadata sync</b>	<p>Defines whether to create versions of metadata when you synchronize metadata between central and local instances.</p>
<b>Don't sync metadata if DHIS versions differ</b>	<p>The metadata schema changes between versions of DHIS2 which could make different metadata versions incompatible.</p> <p>When enabled, this option will not allow metadata synchronization to occur if the central and local instance(s) have different DHIS2 versions. This apply to metadata synchronization done both via the user interface and the API.</p> <p>The only time it might be valuable to disable this option is when synchronizing basic entities, for example data elements, that have not changed across DHIS2 versions.</p>
<b>Best effort</b>	<p>A type of metadata version which decides how the importer on local instance(s) will handle the metadata version.</p> <p><i>Best effort</i> means that if the metadata import encounters missing references (for example missing data elements on a data element group import) it ignores the errors and continues the import.</p>
<b>Atomic</b>	<p>A type of metadata version which decides how the importer on local instance(s) will handle the metadata version.</p> <p><i>Atomic</i> means all or nothing - the metadata import will fail if any of the references do not exist.</p>

## B.12. System monitoring

Use the system monitoring settings when you want to make a call to a URL with user name and password.

**Table B.12. System monitoring settings**

Setting	Description
<b>System monitoring URL</b>	The URL you want to make the call to.
<b>System monitoring user name</b>	The user name you want to use in the call.
<b>System monitoring password</b>	The password for the user name you use in the call.

## B.13. OAuth2 clients

You create, edit and delete OAuth2 clients in the **System Settings** app.

1. Open the **System Settings** apps and click **OAuth2 clients**.
2. Click the add button.
3. Enter **Name**, **Client ID** and **Client secret**.
4. Select **Grant types**.

Grant type	Description
<b>Password</b>	TBA
<b>Refresh token</b>	TBA
<b>Authorization code</b>	TBA

5. Enter **Redirect URLs**. If you've multiple URLs, separate them with a line.

# DHIS2 Glossary

## A

Aggregation	In the context of DHIS2, aggregation refers to how data elements are combined within a particular hierarchical relationship. As an example, all the health facilities in a particular district would contribute to the total value for the particular district in question. Different aggregation operators are supported within DHIS2, such as SUM, AVERAGE, and COUNT.
Aggregate data	In the context of DHIS2, aggregate data refers to either data elements or indicators that have been derived from other hierarchical data sources. For instance, aggregate facility data would result from the aggregate totals of all patients that have attended that facility for a particular service. Aggregate district data would result from the aggregate totals of all facilities contained within a particular district.
Application programming interface	An application programming interface is a specification of how different software components should interact with each other. The DHIS2 API (or WebAPI) can be used to interface DHIS2 with other software, to build reports or custom data entry forms.

## B

Bi-monthly	Refers to a two-month period, such as January 1st to February 28th.
------------	---------------------------------------------------------------------

## C

Category	Categories are groups of category options. They are used in combinations to disaggregate data elements. Categories are typically a single type of concept, such as "Age" or "Gender".
Category combinations	Category combinations are used to disaggregate data elements. As an example, the data element "Number of confirmed cases of malaria" could be disaggregated subdivided into categories: "Age" and "Gender". In turn each of these categories, would consist of several category options, such as "Male" and "Female" for the gender category. Category combinations may consist of one or several categories.
Category combination options	Category combination options are dynamically composed of all of the different combinations of category options which compose a category combination. As an example, two categories "Gender" and "Age", might have options such as "Male"/"Female" and "<5 years"/">5 years". The category combination options would then consist of:  (Male/<5 years) (Male/>5 years) (Female/<5 years) (Female/>5 years)
Category option	Category options are atomic elements that are grouped into categories.

Comma separated values	Comma separated values are series of tabular data stored in a plain-text format. They are commonly used with DHIS2 to export and import data values.
------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------

## D

Data dictionary	A collection of data elements and indicators, which can be exchanged with other DHIS2 systems. Typically used to define a set of data elements and indicators when setting up the DHIS2 system.
Data exchange format	In the context of DHIS2, the "data exchange format" refers to a XML schema that enables the transportation of data and meta-data between disconnected DHIS2 instances, as well as between different applications that support the DXF schema.
Datamart	A set of database tables in DHIS2 that contains processed data elements and indicator values that is generated based on aggregation rules and calculated data element and indicator formulae. Datamart tables are used for analysis and report production. Typically, users should not work directly with unaggregated data values, but rather with values that have resulted from a datamart export for analysis.
Data element	A data element is the fundamental building block of DHIS2. It is an atomic unit of data with well-defined meaning. Essentially it is a data value that has been actually observed or recorded which is further characterized by a number of dimensions. As an example the data element "Number of fully immunized children" would refer to the number of children that received this particular service. Data elements are always linked to a period as well as an organizational unit. They optionally may be linked to other dimensions.
Data element group	Data element groups are used to categorize multiple data elements according to a common theme, such as "Immunization" or "ART". Typically, they are used during reporting and analysis to allow related data elements to be analyzed together.
Data element group sets	Data element groups are used to categorize multiple data element groups into a common theme.
Dimension	A dimension is used to categorize data elements during analysis. Dimensions provide a mechanism to group and filter data based on common characteristics. Typically, related data elements may be aggregated or filtered during analysis with the use of dimensions. Dimensions may be a member of a hierarchy. For instance the "Period" dimension may be broken down into "Day->Month->Quarter->Year".
DXF	See Data exchange format.

## H

Health management information system	Typically, an electronic database system that is used to record aggregated data on service delivery, disease incidence, human resource data and other information used to evaluate the performance of delivery of health services. Typically, an HMIS does not contain the highly detailed data of electronic medical record systems or individual patient data.
--------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**I**

Indicator	The divisor of an indicator. Can be composed of multiple data elements with the use of an indicator formula.
-----------	--------------------------------------------------------------------------------------------------------------

$$\text{indicator} = \frac{\text{numerator}}{\text{denominator}} \quad (1)$$

This is obviously a very generalized example. The numerator and indicator themselves can be composed of various data elements, factors, and the four basic operands (addition, multiplication, division and subtraction).

**N**

Numerator	The dividend of a indicator. Can be composed of multiple data elements and factors with the use of indicator formulas.
-----------	------------------------------------------------------------------------------------------------------------------------

**O**

Organisational unit	An organisational unit is usually a geographical unit, which exists within a hierarchy. As an example, in the United States, "Georgia" would be considered an organisational unit with in the orgunit level of "State". Organizational units can also be used to specify an administrative unit, such as a ward within a hospital. The organisational unit dimension specifies essentially "where" a particular data value occurs.
---------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Organisational unit level	Refers to a level within an organizational hierarchy. Typically, countries are administered at different levels, such as 1) Country 2) States 3) Counties 4) Health facilities. In the context of DHIS2, health facilities typically are the lowest orgunit level. Data is aggregated upwards from the lowest orgunit level to the highest.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**P**

Period	A period is a specific time interval which consists of a start date and end date. For instance "January 2011" would refer to the time interval of January 1st 2011-January 31st 2011.
--------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**U**

Unique identifier	A unique identifier (UID) is a semi-random series of letters and numbers used by DHIS2 to identify specific resources. UIDs begin with a letter, and are followed by exactly 10 letters or digits.
-------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------
